1 Introduction to ISO System Management Software

ABC ISO 
+1 800 644 2056
abci-consultants.com

QMSCAPA for Workgroups, 1.2.17*

QMSCAPA™ stands for Quality Management System, Corrective Actions and Preventive Actions (CAPA).

A Corrective Action Request and Preventative Action Request tracking software system is essential for any quality system. It is a regulatory requirement that FDA / global regulatory inspectors and ISO auditors consider mission critical. When implemented properly, a Corrective Action (CAPA) software system improves product quality and safety, increases customer satisfaction, and more importantly, ensures FDA and ISO compliance.

QMSCAPA™ is a Microsoft Windows compatible software database application, which is designed to generate CAPA forms and a log for a Quality Management Systems based upon the ISO 9001:2008 Standard, AS9100, ISO 13485, TS16949 and TL9000.

QMSCAPA™ is designed by a user group of quality professionals, including assessors, auditors, consultants and quality managers for quality management systems.

Features in Version 1:

- Database for logging [Corrective Actions, Preventive Actions](#), and Non-conformance.
- Database for logging [Customer Complaints](#).
- Internal Audit Schedule for One or More Standards/System.
- [Internal Audit Results](#) Log for Management Review.
- Directory of Management Personnel/Resources.
- Custom CAPA form generator and CAPA report builder.
- Optional database for maintaining a [master document index](#).
- Database for recording personnel that are associated with the QMS.

- Database for recording personnel training records.
- [Vendor database](#) with approval, status and tier levels.
- Support for multiple simultaneous users.
- Multilevel access security and control.
- [On-Time Delivery Calculator](#)
- Customer Satisfaction Survey & Calculator
- Customer Look-up Table linked to Surveys, On-time Delivery logs and the CAPA files.
- Shipping Carrier Table
- [Manufacturing & Production Quality Metrics Calculator](#)
- [Purchasing Quality Metrics Calculator](#)
- [Sales Quality Metrics Calculator](#)
- [Dashboard for Monitoring Quality](#)

Learn [what's new](#) and [what's planned](#) for QMSCAPA software

Computer Requirements:

- Windows XP, SP3, or;
- Windows Vista, Windows 7, Windows 8 or;
- Windows 2003 Server, or;
- Windows 2008 Server, or;
- Windows 2012 Server.

ABCI recommends Windows 2008 Server, or higher with Terminal Services for simultaneous multiple Remote Desktop Users.

*The current application may be later than this publication.

1.1 About ABCI Software

ABC ISO 
+1 800 644 2056
abci-consultants.com

Nothing gets developed, published or implemented unless someone has a goal to get something done, better and faster.

Custom Software Development for Business Applications

We develop software ranging from desktop software through to server-based web systems and a mixture of the two.

Published Software Titles

- [CRMworx](#)™ ~ Contact Management for Workgroups
- [TelcoMgr](#)™ ~ Telecommunications Management Software
- [SWORD](#)™ ~ Field Service & Shop Work Order Routing and Dispatch Software
- [CablePro](#)™ ~ Network Cable Management and Documentation Database
- [ProjexPro](#)™ ~ Simplify Complex Project Management
- [CalcTime](#)™ ~ Calculate Time with Simple Software Tool
- [Custom Software Titles](#)

1.1.1 Tech Support

Need help? Here you go!

We provide several levels of user assistance for our products, from excellent user manuals to direct email support and real-time telephone support, which may include CrossLoop session.

If you have a question about an ABCI Software application, please check out the tutorials and user guides first, which are available for download with each application. You will most probably find your question answered in the appropriate user guide or one of the following online help sites

Help desk

Hours of Operation: M - F 09:00 - 18:00 PST

If you can't find an answer to your question in the user manuals, tutorials

and online web sites, contact us via email:

sherlock@abci-software.com

Optional Real-Time Support (Fee Based):

We also can provide real-time telephone support by appointment. Real-time support may be purchased in advanced by clicking on the following link: Buy Support

1.2 About ABC ISO Consultants

QMSCAPA is sponsored by ABC ISO Consultants

Access Business Communications, Inc., founded in 1999 and incorporated in California, has emerged over the past ten years with an excellent reputation for providing consultation, publications, software and training related to advanced communications and international management systems.

Today we offer the following main services:

- Provide advice and assistance on the development and implementation of systems, including preparation of documentation, work instructions, and forms.
- Assist with the development of procedures for management review, internal auditing and training.
- Identify improvement or development within your current management system.
- Prepare an action plan to address those improvement areas, in conjunction with your personnel.
- Help establish a Process Improvement Team (PIT) to assist with the design and implementation of the system requirements.
- Conduct a health check audit to ensure the effective implementation of your management system prior to external audit by your chosen certification body.
- Assist you with post certification developments of your management system.

2 What's new in QMSCAPA?

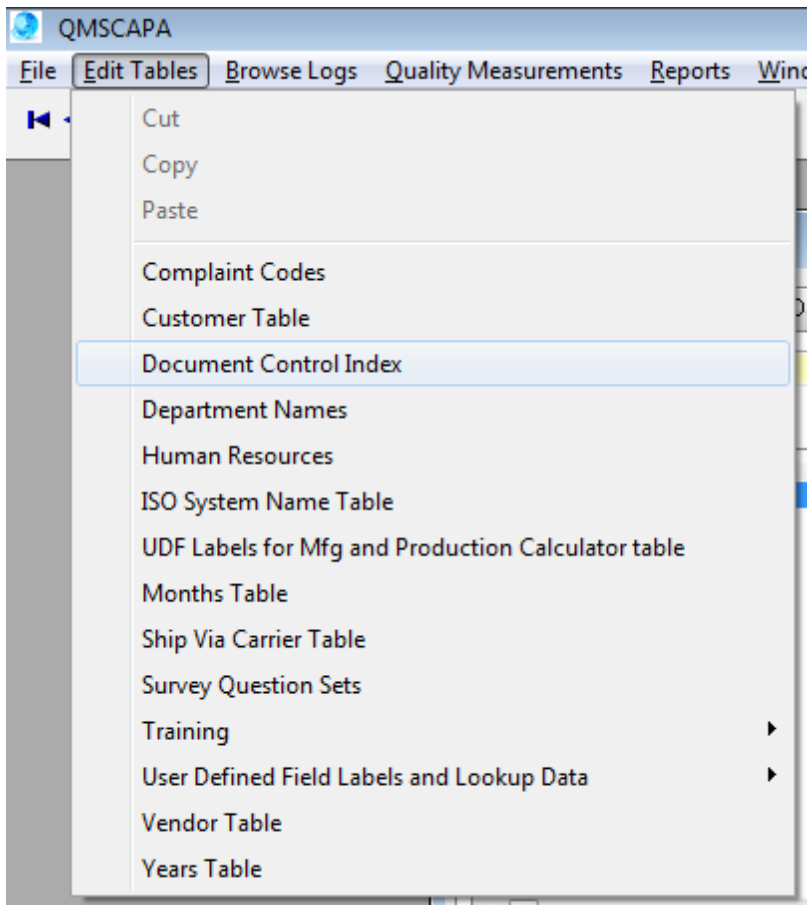

ABC ISO 
+1 800 644 2056
abci-consultants.com

QMSCAPA for Workgroups, 1.2.17

QMSCAPA™ is quality management software designed by a user group of quality professionals, including assessors, auditors, consultants and quality managers for quality management systems. If you have an idea or new feature that you would like to see in **QMSCAPA** please join our user group by completing our [web form](#).

06/16/2014 Version 1.2.17

- 1) Added new features to the Document Management Module;
 - a. Moved the Document Control Index to the '**Edit Table**' menu option.
 - b. Added Approved Date field;
 - c. Added Effective Date field;
 - d. Added Numeric Version counter field;
 - e. Added File Path & Name field;
 - f. Added a [Document Version History](#) table;
 - g. Updated Document Index by Document Id (report);
 - h. Updated Document Index by Title (report);
 - i. Add Document Index by Path & File Name (report).

05/05/2014 Version 1.1.7

- 2) Added support for the Windows 8 manifest;
- 3) Added support for the Windows Server 2012 Edition;
- 4) Corrected and tweaked user interface.

10/27/2012 Version 1.0.635

- 1) Added a [Customer Complaint](#) browse tables and reports.

10/09/2012 Version 1.0.607

- 1) Corrected the way MS Word is loaded for Spell Checking. MS Word is loaded in the background when the F7 Key is depressed.

10/06/2012 Version 1.0.598

- 1) Added [Training Programs](#) browse tables and reports, includes training courses, training schedule and trained student records.
- 2) Added a process for identifying [Audit Plans](#) to Copy the annual *internal audit schedule* for one or more standards from year to year.
- 3) Added '[Spell Check](#)' for 'text fields' on most of the primary window forms.

7/20/2012 Version 1.0.498

- 1) Added framework and databases for new [Dashboard for Monitoring Quality](#), which includes Quality Measurement Dashboard table, Dashboard window and a Quality Dashboard report.
- 2) Corrected look-up for the Company file when printing reports. Company logo and name print correctly again.
- 3) Created standalone File Manager bot for external database maintenance.

7/3/2012 Version 1.0.418

- 1) [Manufacturing and Production Quality Calculator](#)
 - a) Added a Manufacturing and Production table and form for calculating the over-all quality score as a percentage.
 - b) Added Mfg. and Production Analysis report for monitoring Manufacturing and/or Production quality.
- 2) [Purchasing Quality Metrics Calculator](#)
 - a) Added a Purchasing table and form for calculating the over-all purchasing quality score as a percentage.
 - b) Added a Purchasing Analysis report for monitoring Purchasing quality.
- 3) [Sales Quality Metrics Calculator](#)
 - a) Added a Sales Contract table and form for calculating the over-all Sales quality score as a percentage.
 - b) Added a Sales Analysis report for monitoring Sales quality.

6/24/2012 Version 1.0.362

- 4) Added Department Name lookup table to the Employee table and form.
- 5) Added a Customer lookup table in the CAPA form.
- 6) Corrected the Vendor lookup in the CAPA form.
- 7) Added [Customer Survey & Satisfaction Calculator](#)
 - a) Added a table for multiple Customer Survey Questions sets, which provides flexibility for many different industry and business types.
 - b) Added Survey table and form for calculating customer satisfaction.
 - c) Added Survey form printing.
 - d) Added Survey results reports for monitoring customer satisfaction.
- 8) [On-time Delivery Log & Calculator](#)
 - a) Added Delivery table and form for calculating delivery and shipping results.
 - b) Added On-time Delivery Analysis report for monitoring on-time delivery.

3/12/2012 Version 1.0.247

- 1) Moved security file to user selected data folder.
- 2) Made login optional for first time users.
- 3) Minor window and tab sequence adjustments.

2/18/2012 Version 1.0.239

- 1) Added to horizontal and vertical scroll bars to the main window document frame to allow easier navigation on smaller computer screens.
- 2) Fixed tab order on the CAPA form window.
- 3) Added cwhhla.dll to installation wizard.

2/11/2012 Version 1.0.219

- 1) Added [vendor table](#)
 - a) Added vendor field to [CAPA window](#) and printed form
 - b) Added two [Vendor reports](#)
 - i) By vendor name in alphabetical order
 - ii) By Tier Level and vendor name in alphabetical order

1/18/2012 Version 1.0.201

- 1) [Internal Audit Schedule](#)
 - a) [Internal Audits Log](#)
 - b) [Internal Audit Reports](#)
- 2) Fixes
 - a) The Reports Directory now follows the user select Data Directory.

3 What's planned for QMSCAPA?

If you have not joined our [QMSCAPA user group](#), we encourage your joining and welcome your input on how we can improve QMSCAPA.

The planning information and feature descriptions that appear under the topic "What's Planned for QMSCAPA" are subject to change without notice. Some features may be incorporated into a custom version and released as a minor product upgrade (number to the right of the decimal in a version designation and formed as #.#).

Do you have a suggestion or improvement for QMSCAPA? Contact sherlock@abci-software.com. The following is our current "To Do List" to improve QMSCAPA.

Future Development

- Customer Complaint input form and database
- Management Review input form and database.
- Product and customer requirements review form and actions arising from the review.
- Design input records database relating to product requirements, design review and necessary actions.
- Results of the design verification database.
- Supplier evaluation form and database.
- Validation of processes form and database.
- Unique identification of products database.

ABC ISO 
+1 800 644 2056
abci-consultants.com

- Customer property records of lost or damaged customer property and communication to the customer.
- Records to record the person authorizing the release of product.
- Database for recording the calibration of measuring and monitoring devices.

4 Download QMSCAPA Software

4.1 EULA

ACCESS BUSINESS COMMUNICATIONS, INC. (ABCI)
ELECTRONIC END USER LICENSE AGREEMENT (EULA)
FOR QMSCAPA™

ABC ISO
+1 800 644 2056
abci-consultants.com

NOTICE TO USER:

THIS IS A CONTRACT. BY INSTALLING THIS SOFTWARE YOU ACCEPT ALL THE TERMS AND CONDITIONS OF THIS AGREEMENT.

This **ACCESS BUSINESS COMMUNICATIONS, INC.** ("ABCI") End User License Agreement accompanies the ABCI QMSCAPA product and related explanatory materials "Software"). The term "Software" also shall include any upgrades, modified versions or updates of the Software licensed to you by ABCI. Please read this Agreement carefully. At the end, you will be asked to accept this agreement and continue to install or, if you do not wish to accept this Agreement, to decline this agreement, in which case you will not be able to use the Software.

Upon your acceptance of this Agreement, ABCI grants to you a nonexclusive license to use the Software, provided that you agree to the following:

1. Use of the Software. Simply stated, each single user licenses grants the user permission to use one copy of QMSCAPA on one single hard drive.

- You may install the Software on a hard disk or other storage device; install and use the Software on a file server for use on a network for the purposes of (i) permanent installation onto hard disks or other storage devices or (ii) use of the Software over such network; and make backup copies of the Software.

- You may not make and distribute copies of the Software, including copies for commercial distribution.

2. Copyright and Trademark Rights. The Software is owned by ABCI and its suppliers, and its structure, organization and code are the valuable trade secrets of ABCI and its suppliers. The Software also is protected by United States Copyright Law and International Treaty provisions. You may use trademarks only insofar as required to comply with Section 1 of this Agreement and to identify printed output produced by the Software, in accordance with accepted trademark practice, including identification of trademark owner's name. Such use of any trademark does not give you any rights of ownership in that trademark. Except as stated above, this Agreement does not grant you any intellectual property rights in the Software.

3. Restrictions. You agree not to modify, adapt, translate, reverse engineer, decompile, disassemble or otherwise attempt to discover the source code of the Software. Although you may customize the installer for the Software as documented on the ABCI QMSCAPA CD-ROM or web site download file (e.g., installation of additional help files), you may not otherwise alter or modify the installer program or create a new installer for the Software.

4. No Warranty. The Software is being delivered to you AS IS and ABCI makes no warranty as to its use or performance. ABCI and its suppliers do not and Cannot warrant the performance or results you may obtain by using the software Or documentation. ABCI and its suppliers make no warranties, express or Implied, as to noninfringement of third party rights, merchantability, or Fitness for any particular purpose. In no event will ABCI or its suppliers be Liable to you for any consequential, incidental or special damages, including Any lost profits or lost savings, even if an ABCI representative has been Advised of the possibility of such damages, or for any claim by any third Party. Some states or jurisdictions do not allow the exclusion or limitation of incidental, consequential or special damages, or the exclusion of implied warranties or limitations on how long an implied warranty may last, so the above limitations may not apply to you.

5. Governing Law and General Provisions. This Agreement will be governed by the laws of the State of California, U.S.A., excluding the application of its conflicts of law rules. This Agreement will not be governed by the United Nations Convention on Contracts for the International Sale of Goods, the application of which is expressly excluded. If any part of this Agreement is found void and unenforceable, it will not affect the validity of the balance of the Agreement, which shall remain valid and enforceable according to its terms.

You agree that the Software will not be shipped, transferred or exported into any country or used in any manner prohibited by the United States Export Administration Act or any other export laws, restrictions or regulations. This Agreement shall automatically terminate upon failure by you to comply with its terms. This Agreement may only be modified in writing signed by an authorized officer of ABCI.

6. Notice to Government End Users. The Software and Documentation are "Commercial Items," as that term is defined at 48 C.F.R. §2.101, consisting of "Commercial Computer Software" and "Commercial Computer Software Documentation," as such terms are used in 48 C.F.R. §12.212 or 48 C.F.R. §227.7202, as applicable. Consistent with 48 C.F.R. §12.212 or 48 C.F.R. §§227.7202-1 through 227.7202-4, as applicable, the Commercial Computer Software and Commercial Computer Software Documentation are being licensed to U.S. Government end users (A) only as Commercial Items and (B) with only those rights as are granted to all other end users pursuant to the terms and conditions herein. Unpublished-rights reserved under the copyright laws of the United States.

4.2 User Guide as PDF

ABC ISO
+1 800 644 2056
abci-consultants.com

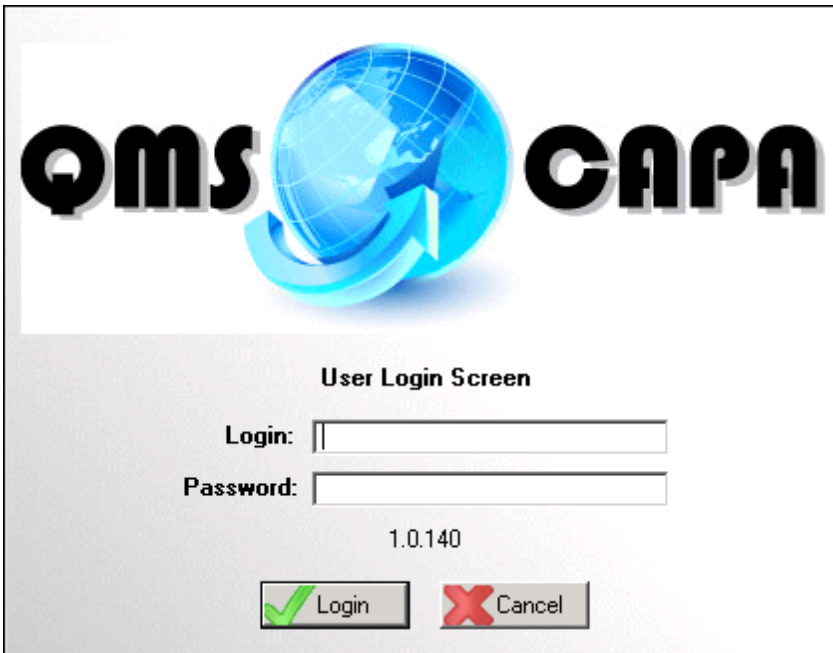

[Download User Guide as PDF](#)

CAUTION: This is a large file, which is a replicate of the online User Guide. Unfortunately, the PDF version is not updated as often as the online version.

5 Quick Start Steps

Follow these simple steps to begin using QMSCAPA.

ABC ISO
+1 800 644 2056
abci-consultants.com

The QMSCAPA application may have the [security](#) feature activated.

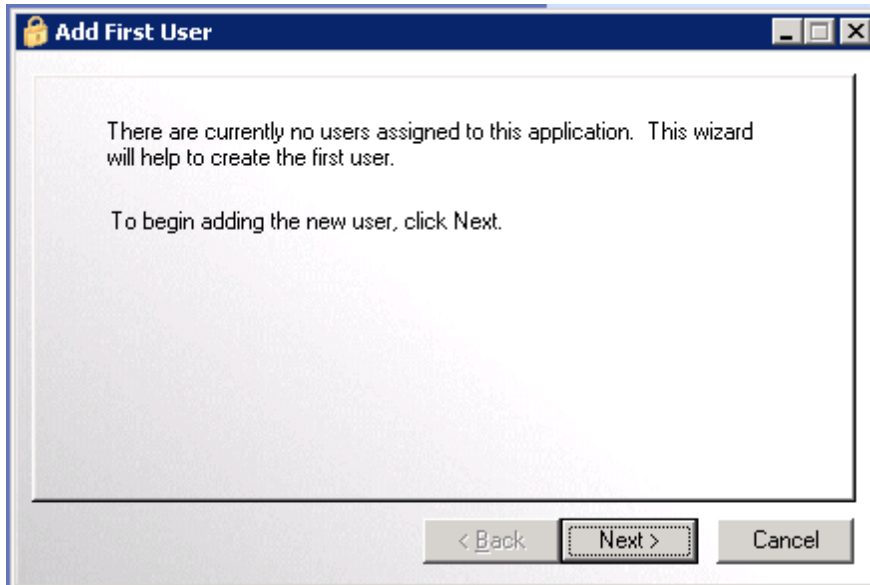

The default Login and Password for QMSCAPA is 'mgtrp.'

Note: New first-time users may see the Path Manager window open to set the [default data path](#).

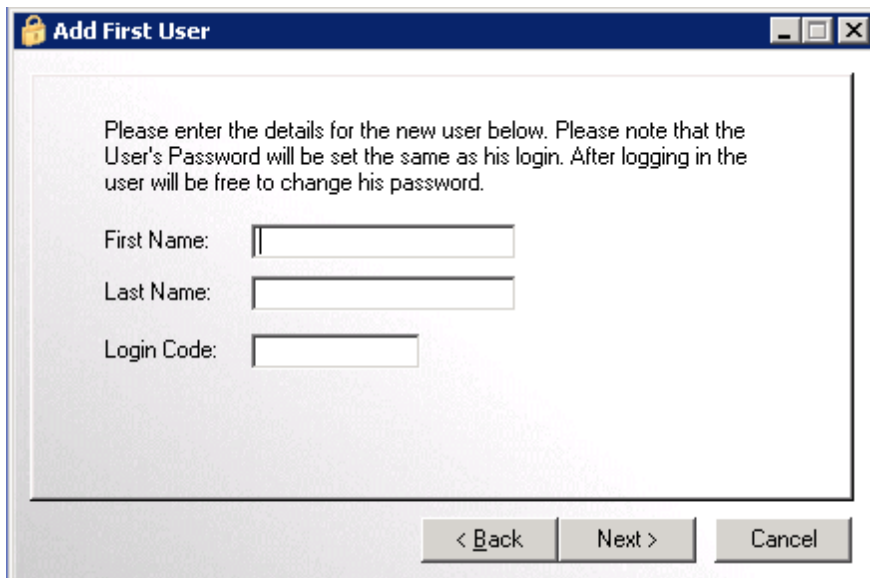

5.1 Add a First User

First-time users may be required to enter the "first user."

ABC ISO
+1 800 644 2056
abci-consultants.com

The "first-user" is also considered the primary system manager.

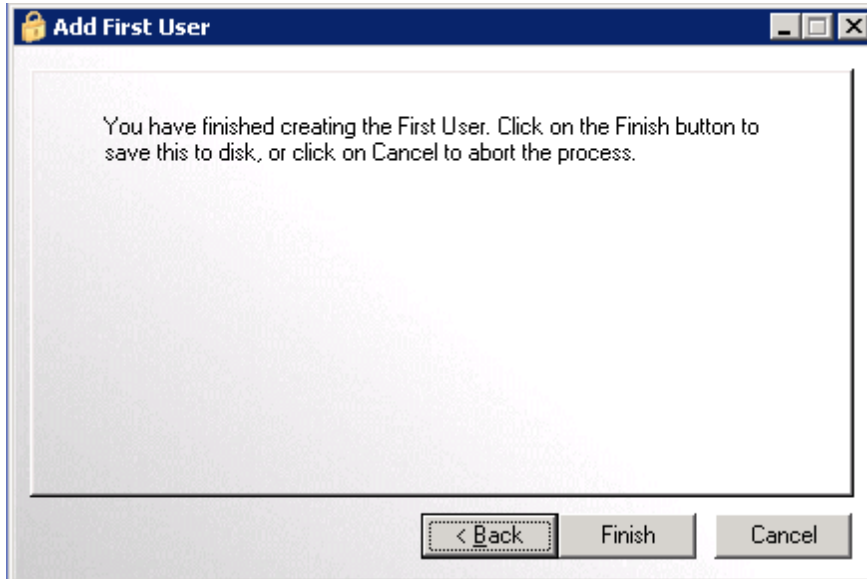

Suggested first-user:

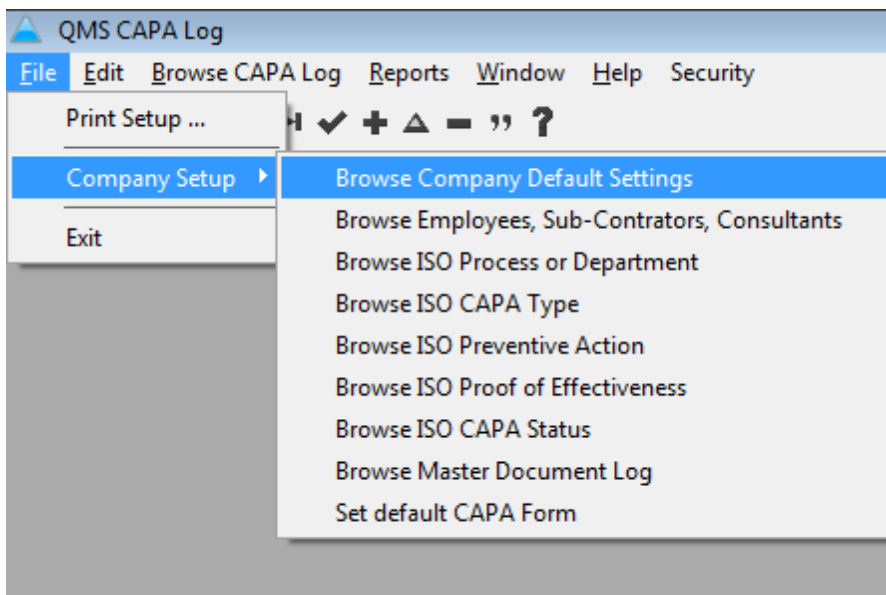

First Name: Management

Last Name: Representative

Login Code: mgtrep (The login code is also the first password!)

5.2 Edit Company information

ABC ISO
+1 800 644 2056
abci-consultants.com

1. Add or edit your company information and select an appropriate logo "image.jpg" file.

1) By Company Id

| Company ID | Company Name | Address 1 | Address 2 | City | State | Zip | Licens |
|------------|-----------------------|-------------------------|-----------|------------------|-------|-------|--------|

5.3 Add Human Resources

As a minimum you will need to add the personnel that QMS responsibilities, including:

- Anyone allowed to generate a Corrective Action Request or Preventive Action Request;
- Anyone that may be assigned to handle a CAPA;
- Anyone that may be required to verify a finding;
- Internal Auditors;
- Management Representatives;
- Anyone that may be required to conduct a Management Review of CAPAs.

5.4 Add QMS Processes and Departments

Add the QMS Procedures and Departments table which may directly be associated with quality.

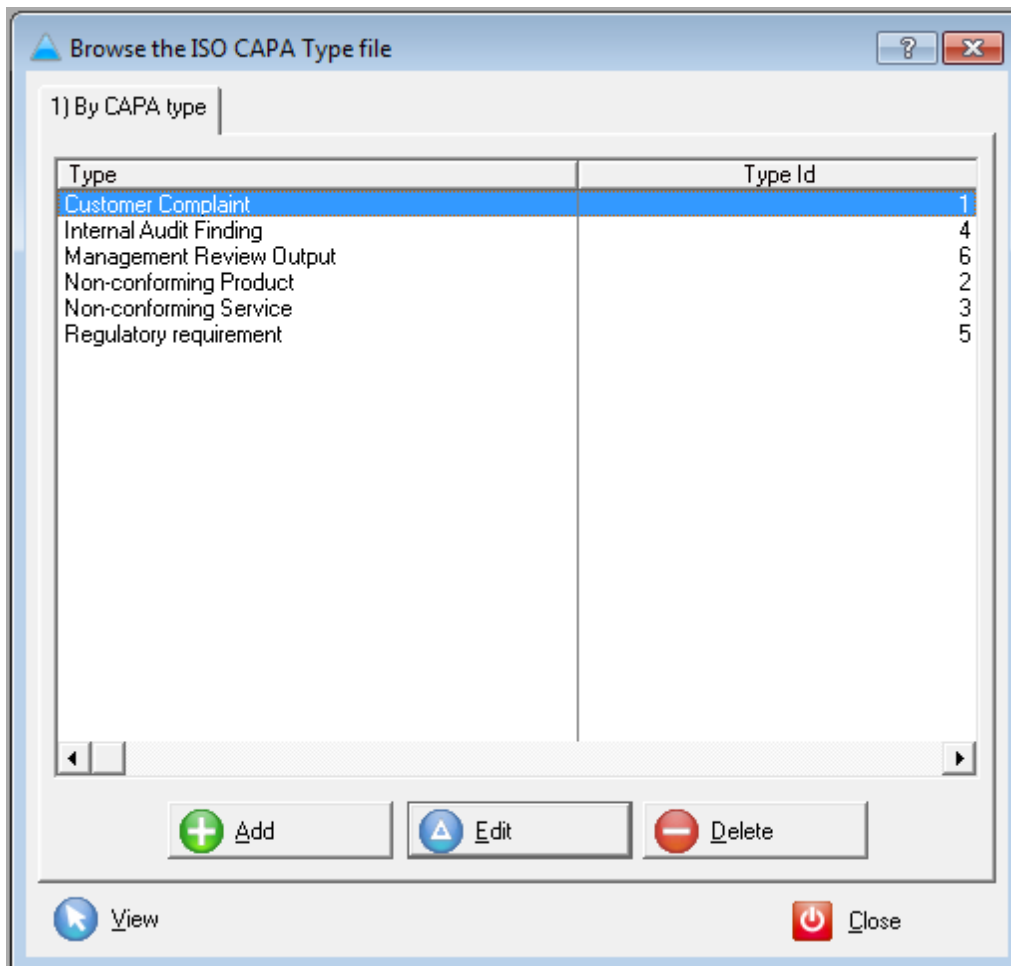

ABC ISO
+1 800 644 2056
abci-consultants.com

5.5 Add CAPA Types

Add or edit the CAPA Types table.

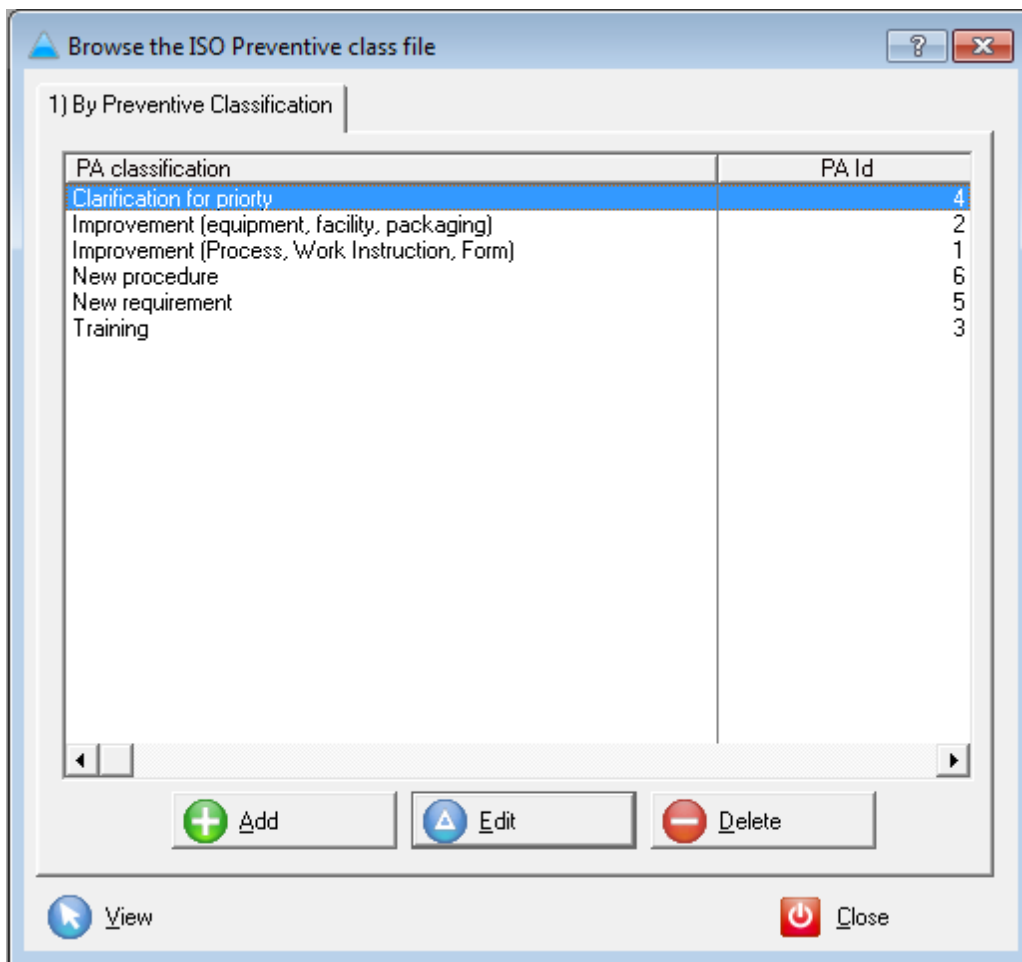

ABC ISO 
+1 800 644 2056
abci-consultants.com

5.6 Add Preventive Action Classifications

Add or edit Classifications for Preventive Action Request table.

ABC ISO
+1 800 644 2056
abci-consultants.com

5.7 Add or Edit CAPA Status

Add or edit the CAPA Status table.

ABC ISO 
+1 800 644 2056
[abci-
consultants.com](http://abci-consultants.com)

The follow CAPA status records should not be deleted or changed:

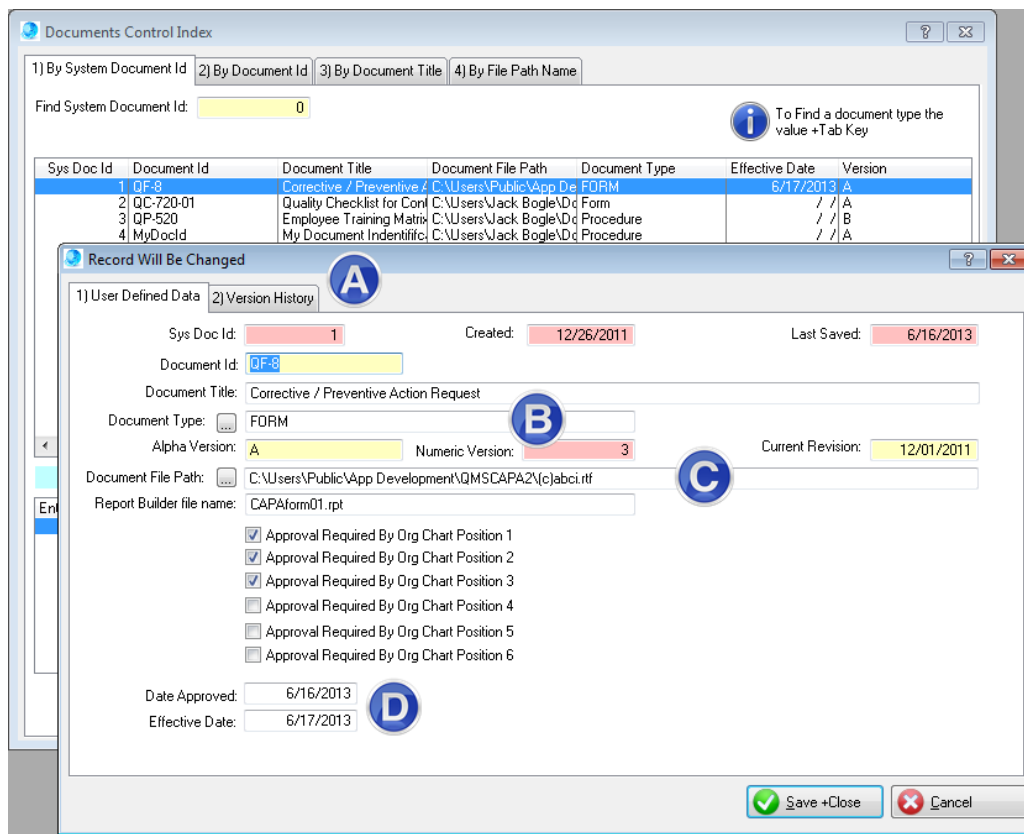

1. Completed
2. New CAPA
3. Open
4. Rescheduled

5.8 Add Master Document Index

Add or edit the Master Document Index table; a.k.a. Document Control Index.

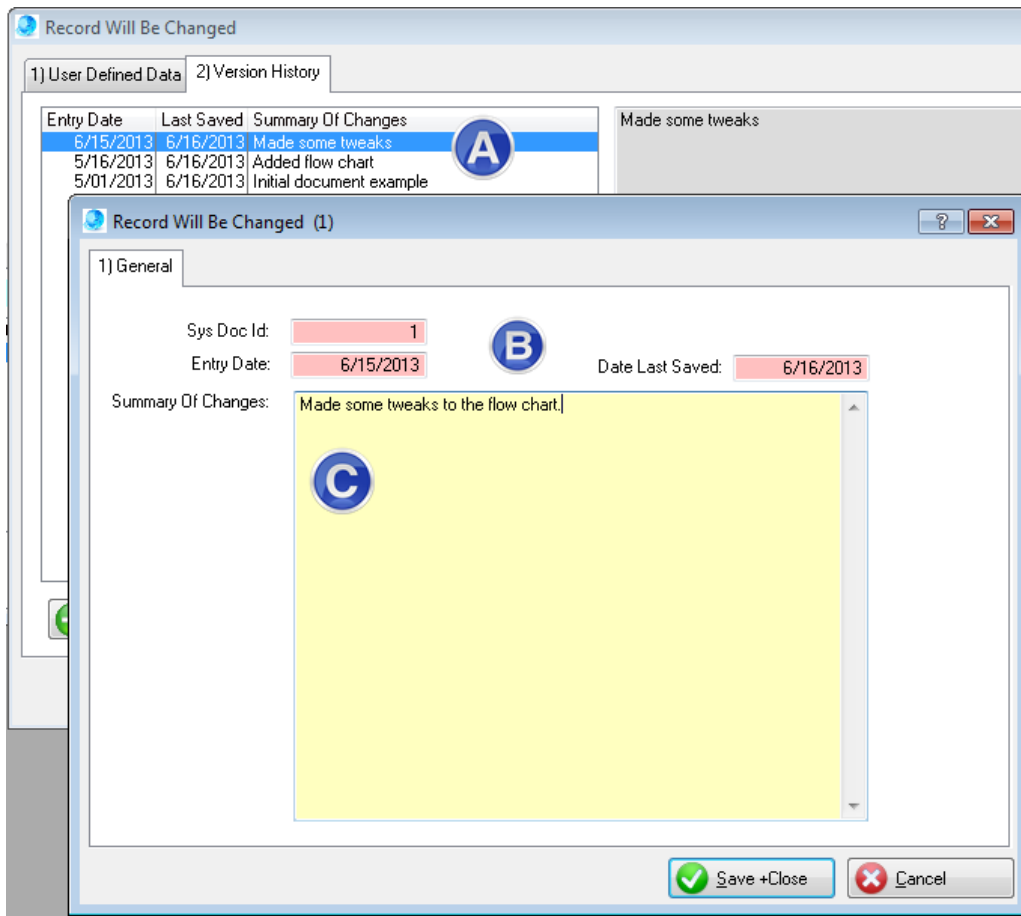

As a minimum, you must add your CAPA form.

ABC ISO
+1 800 644 2056
abci-consultants.com

- A. [Version history](#) may be recorded on the 2) Version History tab.
- B. Alpha or numeric version identification.
- C. Store the full path to the actual document.
- D. Date approved and the effective date of the document may be recorded.

5.9 Document Version History

- A. The document version history table displays the 'entry date' in descending order so the most recent change is displayed first.
- B. The 'entry date' and 'last saved' are automatically generated.
- C. The 'summary of changes' is a free form field to describe key changes to the controlled document.

5.10 Set the default data path

New first-time users may need to navigate to the QMSCAPA data folder.

The default setting is **C:\Users\Public\Documents\ABC\QMSCAPA**;
Of course, if you are installing QMSCAPA on a server or shared drive you will need to set the appropriate shared folder privileges for one or more users.

ABC ISO
+1 800 644 2056
abci-consultants.com

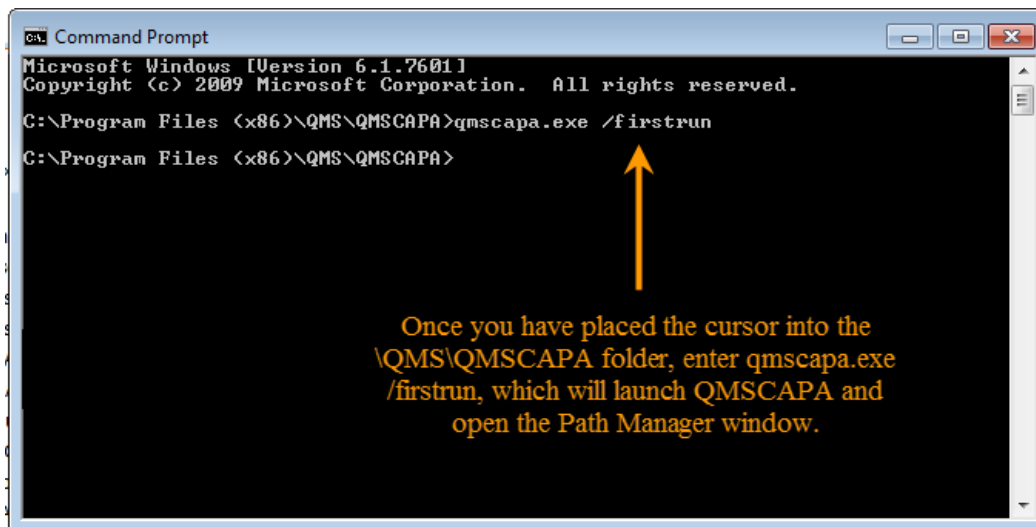

The default location for the QMSCAPA.EXE file is:

```
c:\Program Files (x86)\qms\qmscapa\
```

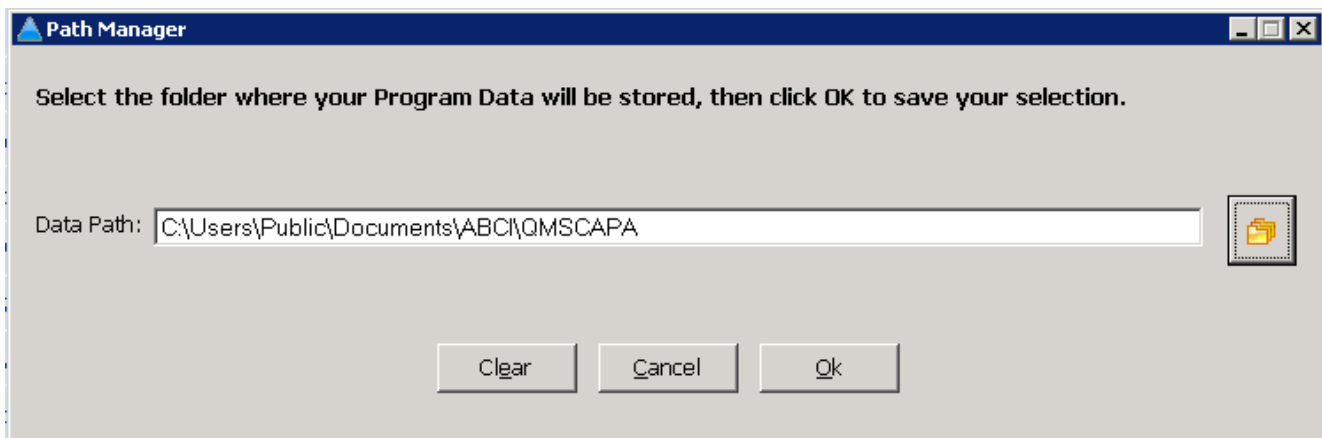

Note about the FIRST RUN option and the Path Manager window

If you move the QMSCAPA data folder you will need to reset the path for the QMSCAPA data folder from the "Windows OS Command Prompt."

```
c:\Program Files (x86)\qms\qmscapa\qmscapa.exe /firstrun
```

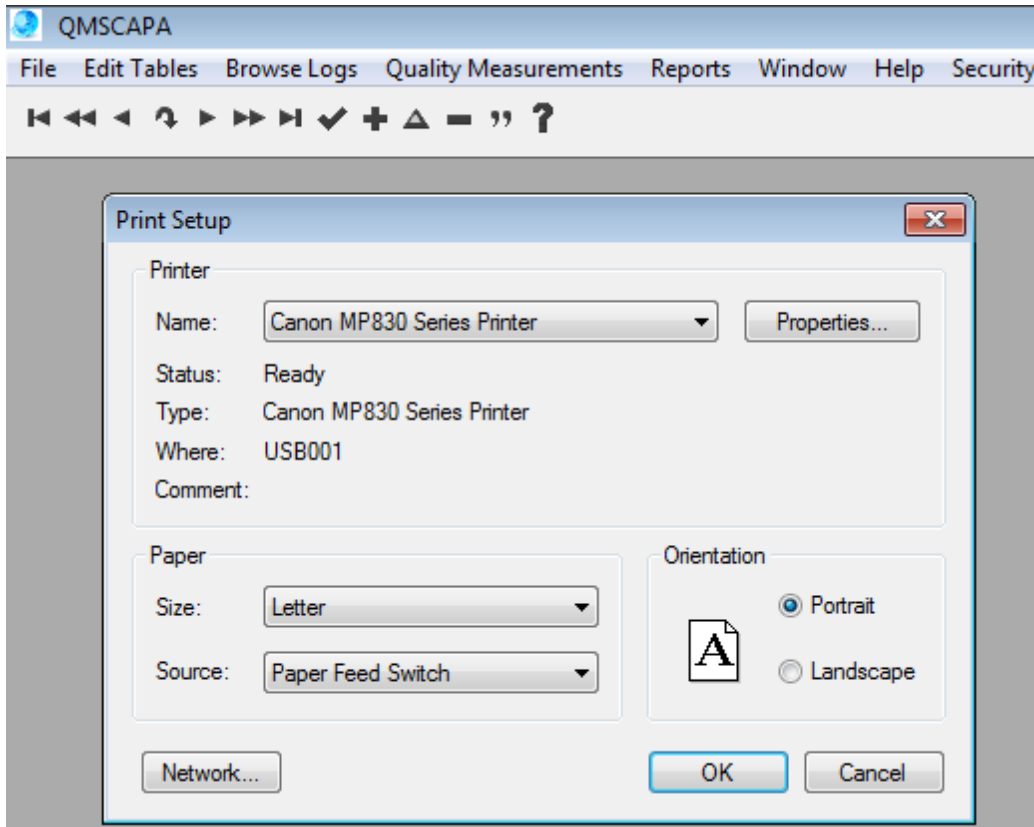

The 'FIRSTRUN' option will launch QMSCAPA and open the Path Manager window.

5.11 Set a Default Printer

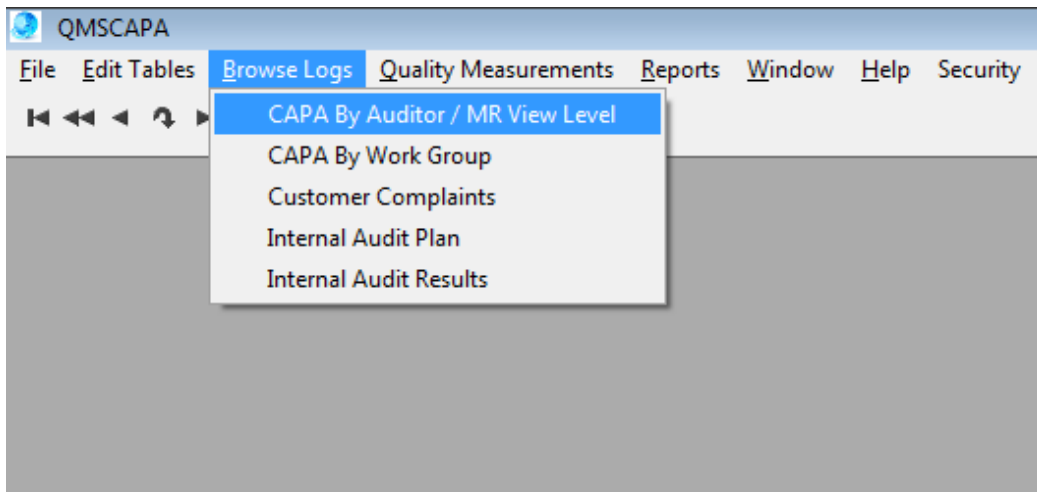

QMSCAPA requires a default printer set in the Windows OS to print preview or to print to a printer devices.

ABC ISO
+1 800 644 2056
abci-consultants.com

6 Browse CAPA Log

ABC ISO
+1 800 644 2056
abci-consultants.com

The Browse CAPA Log menu provides two options:

1. By Auditor / MR View Level, shows all CAPAs for all users/groups and requires a "supervisor" login or the appropriate access rights applied to a specific login.
2. By Work Group, shows all CAPAs for the Current Work Group (CWG code) as set by the users login rights.

The CAPA table may be viewed according to the following sort orders:

1. By CAPA Id
2. By CWG (Current Work Group)
3. By Due Date
4. By CAPA Process or Department
5. By CAPA Type
6. By Status & Due Date
7. By Preventive Action Classification
8. By Author (originator) & Created Date
9. By Assigned & Due Date
10. By Verifier & Due Date

6.1 Add or Edit a CAPA

The CAPA window form is divided into two tabs:

- 1) Corrective Action and NonConformity, and;
- 2) Preventive Action Request and Auditor/MR Review

- Corrective Action and NonConformity Tab:

1. Use the default CAPA form name/number, the Version and Effective Date are populated by the Form Id.
2. Enter the appropriate CAPA Due Date.
3. The Created and Saved dates are automatically generated.
4. The Author Name is the person who originates the CAPA request.

5. The Process or Department that is most directly involved with the Statement of Concern or problem.
6. The Type of CAPA is related to the Action Request or Preventive Action and, or non-conformances.
7. The Client information is optional.
8. **Assigned to** is the person who will be taking or leading the Corrective Action or Preventive Action.
9. The CWG (Current Work Group) is a code that is related to the person or a group the person belongs as a member. The CWG is used to filter CAPAs that are for a specific person or group.
10. The Statement of Concerns is required.
11. The Statement of Cause, also known as "root cause."
12. The Corrective Action is a required.
13. The "CA completed by" is the person that completes the Corrective or Preventive Action request, which may be the same as the "Assigned to" person.
14. The CA attachment is optional.
15. The "CA completed date" is related to the Correction Action completion.
16. The "CAPA Status" is related to whether or not the CA or PA has been acted upon and, or completed.
17. If the CAPA Status is set to "New CAPA" then the "new CAPA Id number" should be entered into the "CAPA Reference" field.

Statement of Concerns or Problems and immediate action taken
 Statement of concern or problem sample text: This course introduces personnel to the business management concepts of ISO 9001:2008 with a general overview of the standard, discussing origin and basic concepts. Also includes information on the registration audit process and the role of the auditee. In particular, /what do you do when the Lead Auditor asks you a question that you don't know how to answer.

Statement of Cause
 Statement of clause sample text: Using your company's own examples of corrective actions, we will discuss, understand and apply the seven step process to better appreciate the application of the seven step process.
 The real problem with the typical correction/root cause analysis action training class is that after the class, everyone goes back to doing what they were doing before the class. I will provide a checklist in

Corrective Action
 Corrective Action sample text: Simplify your TS-16949 implementation through proper understanding of Customer-Oriented Processes (COP's), Management-Oriented Processes (MOP's) and Support-Oriented Processes (SOP's). Session includes identification of these processes and their subsequent monitor and measurement strategic goal deployment. A detailed discussion of efficiency versus effectiveness ensues.

8 Quality Measurements

ABC ISO
+1 800 644 2056
abci-consultants.com

QMSCAPA v1.0.361

QMSCAPA v1.0.48 includes six Quality Measurement tools:

- [Customer Survey & Satisfaction Calculator](#)
- [On-time Delivery Log & Calculator](#)
- [Manufacturing and/or Production Calculator](#)
- [Purchasing Quality Calculator](#)
- [Sales Quality Calculator](#)
- [Dashboard for Quality Monitoring](#)

8.1 Customer Survey & Satisfaction Calculator

The Customer Survey and Satisfaction Calculator contains:

- A survey log or running table of survey questionnaires that are recorded.
- A Survey Form, which is designed to generate a Survey Questionnaire that can be sent to a customer and capture the results returned by the customer.
- The Survey Questionnaire is designed for 10 rating type questions that are answered on a scale of 1 to 10. Therefore the highest possible score is 100.
- The 10 X 10 Survey can be easily modified or customized for a variety of surveys, including a 5 question and scale of 1 to 5 rating.
- Survey Sets are a collection of Survey questions and our elements of customer satisfaction. The select a Survey Set through the lookup table will populate the question fields in the Survey Form window.
- The [Customer Id field] is a reference to your customer and is linked to

ABC ISO
+1 800 644 2056
abci-consultants.com

Quality Management
Systems

Customer lookup table.

- Survey Groups may be used to designate regions, products and other user defined purposes.
- The Completed checkbox may be used to signify that the response from the customer has been recorded and completed.
- The numerical spin field limits the rating response to be between 1 and 10.
- The Comments Tab may be used to record customer comments.

The screenshot displays the QMSCAPA application window. The main window shows a table with columns for Survey Date, Cus ID, Order #, Company Name, Survey Set, Survey Group, and four Answer fields. A dialog box titled 'Record Will Be Changed' is open, showing details for a specific record. The dialog includes fields for Survey Set, Customer ID, Survey Date, Customer Name, Order #, Survey Group, Taken By, Respondent, and a list of 10 questions with associated rating spinners. The 'Completed' checkbox is checked.

| Survey Date | Cus ID | Order # | Company Name | Survey Set | Survey Group | Answer 1 | Answer 2 | Answer 3 | Answer 4 |
|-------------|--------|---------|----------------------|------------|-------------------------|----------|----------|----------|----------|

8.3.1 On-time Delivery Calculator Form

The Calculator Form contains the following features:

- Author lookup table from the Employee file.
- Optional Customer Reference lookup from the Customer file.
- Optional User Defined field label and User Defined data lookup table.
- Optional Shipping Carrier lookup table.

On-time delivery is calculated by two mutually exclusive formulas.

- 1) The **Ship by Date** is subtracted from the **Actual Ship Date**.
 - a) SBD vs. ASD field records the variance as a minus value, zero or a positive value.
 - b) A minus value means the delivery was early by a variable quantity of days.
 - c) A zero indicates the delivery was on-time.
 - d) A positive number indicates the delivery was late by a variable quantity of days.
- 2) The **Customer Due Date** is subtracted from the **Actual Received Date**.

- a) CDD vs. ARD field records the variance as a minus value, zero or a positive value.
- b) A minus value means the delivery was early by a variable quantity of days.
- c) A zero indicates the delivery was on-time.
- d) A positive number indicates the delivery was late by a variable quantity of days.
- e) The **Actual Received Date** is estimated by using the **Customer Due Date** and the results are not calculated until the **Actual Received Date** can be verified by checking the **Verified Actual Delivery Date**.

Record Will Be Changed

1) General

Rec Id: 2 Entry Date: 6/23/2012

*Author: JTB Last Saved: 6/24/2012

Customer Reference #: 4 Order Number: 22222222

*Customer Name: Customer Four

User Defined Label: Select User Defined Field Label

User Defined Identification:

Date Of Order: 6/19/2012

Carrier Name: UPS

Tracking Number:

*Ship By Date: 6/24/2012

*Customer Due Date: 6/29/2012

*Actual Ship Date: 6/23/2012 SBD vs ASD: -1 Early On-time Late

Actual Received Date: 6/29/2012 CDD vs ARD: 0 Early On-time Late

Verified Actual Delivery Date

Comments:

The Actual Received Date is estimated according to the Customer Due Date and excluded from On-Time Delivery reports, unless the Verified Actual Delivery Date is checked.

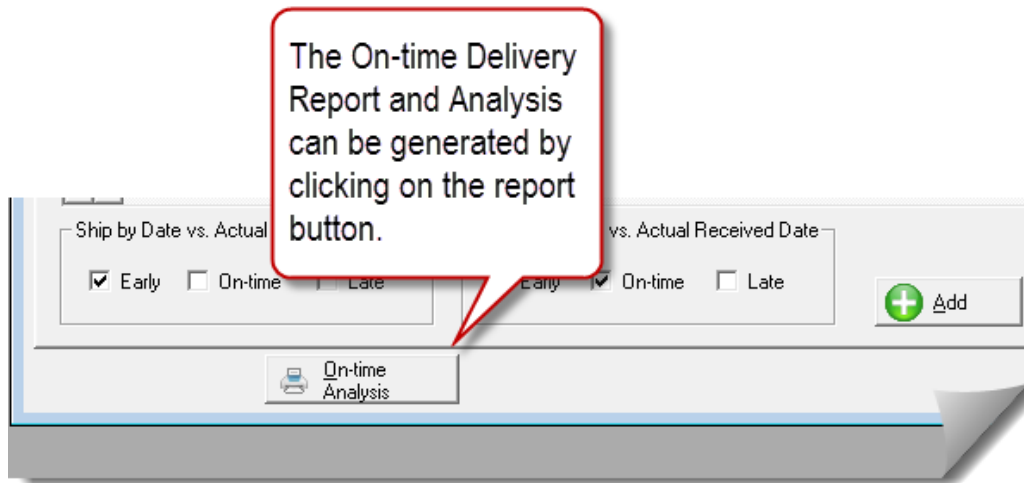

Save +Close Cancel

8.3.2 On-time Delivery Analysis Report

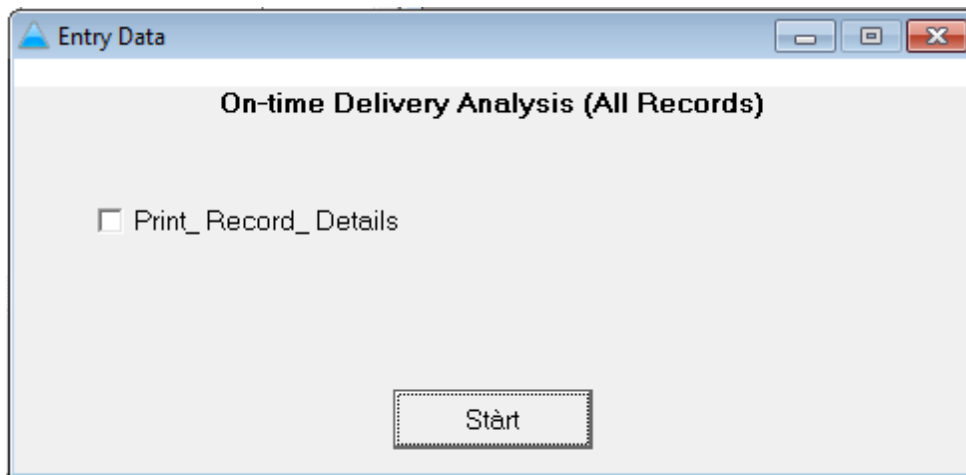

The On-time Delivery Analysis Report shows the results of both on-time delivery formulas.

- SBD vs. ASD = Ship by Date is subtracted from the Actual Shipped Date
- CDD vs. ARD = Customer Due Date is subtracted from the Actual Received Date

Quality
Management
Systems

Optionally you can print a summary analysis or a full shipping log with the analysis.

- 1) In section 1 below the actual shipping log is displayed.
- 2) Number 2 shows the Total Shipments in the analysis.
- 3) Number 3 shows the SBC vs. ASD comparison as percentages for early shipments, on-time shipments and late shipments.
- 4) Number 4 shows the CDD vs. ARD comparison as percentages for early shipments, on-time shipments and late shipments.

The screenshot shows the QMSCAPA software interface. A 'Record Will Be Changed' dialog box is open, prompting the user to enter values for sales metrics. The dialog includes the following fields and options:

- Rec Id: 11
- Entry Date: 7/02/2012
- Last Saved: 7/02/2012
- Label Set: 1 (indicated by a circled '1')
- Author Initials: (empty)
- Product / Services Id: (empty)
- UDF Label: Select User Defined Field Label
- UDF Data: (empty)
- Label 1: Sales Orders, QM 1: 8000
- Label 2: Canceled, QM 2: 800, Add To QM 2 To QM 1
- Label 3: Problem with Order, QM 3: 80, Add To QM 3 To QM 1
- Label 4: RMA Requested, QM 4: 40, Add To QM 4 To QM 1
- Label 5: Net Sales Orders, QM 5: 7,080

The background table shows a list of records with columns: Entry Date, Label Set, Last Saved, Product / Services Id, UDF Label, UDF Data, Author, and Rec Id. The table contains 11 rows of data, with the last row highlighted in blue.

- 1) Set a Label Set to auto-populate the Metrics Labels (labels 1 through 5 and the 'Add To ... check boxes.')
- 2) The metrics labels are user defined and controlled by the Label Set look-up table.
- 3) By default the values of QM2, QM3 and QM4 are subtracted from QM1. Optionally the values of QM2, QM3 and QM4 may be added to QM1 if the check boxes are checked .
- 4) The boxes are read only on the Sales Quality Calculator form and controlled by the Metrics Label Set look-up table

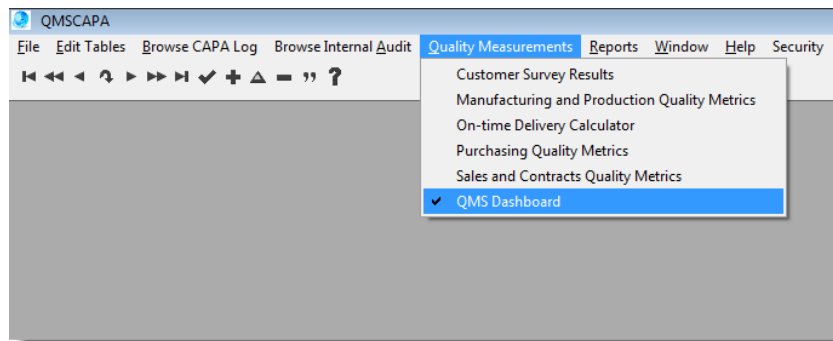

9 Dashboard for Monitoring Quality

The QMSCAPA Dashboard for Monitoring Quality accumulates all of the quality measurements that are recorded in QMSCAPA.

The **QMS Dashboard** consists of:

consultants.com

- ✓ The QMS Dashboard table, which is designed to capture quality measurements over a period of time. You can accumulate quality measurements on user-defined intervals. For example, you can record quality measurements monthly, quarterly, semi-annually or annually, among others.
- ✓ The QMS Dashboard form is a quality measurement calculator that provides a roll-up of data according to a user-defined date range.
- ✓ Any QMS Dashboard data can be easily printed simply by selecting the appropriate dashboard record in the QMS Dashboard Table.
- ✓ The QMS Dashboard may be configured according to user-defined settings in the Dashboard Label Sets.

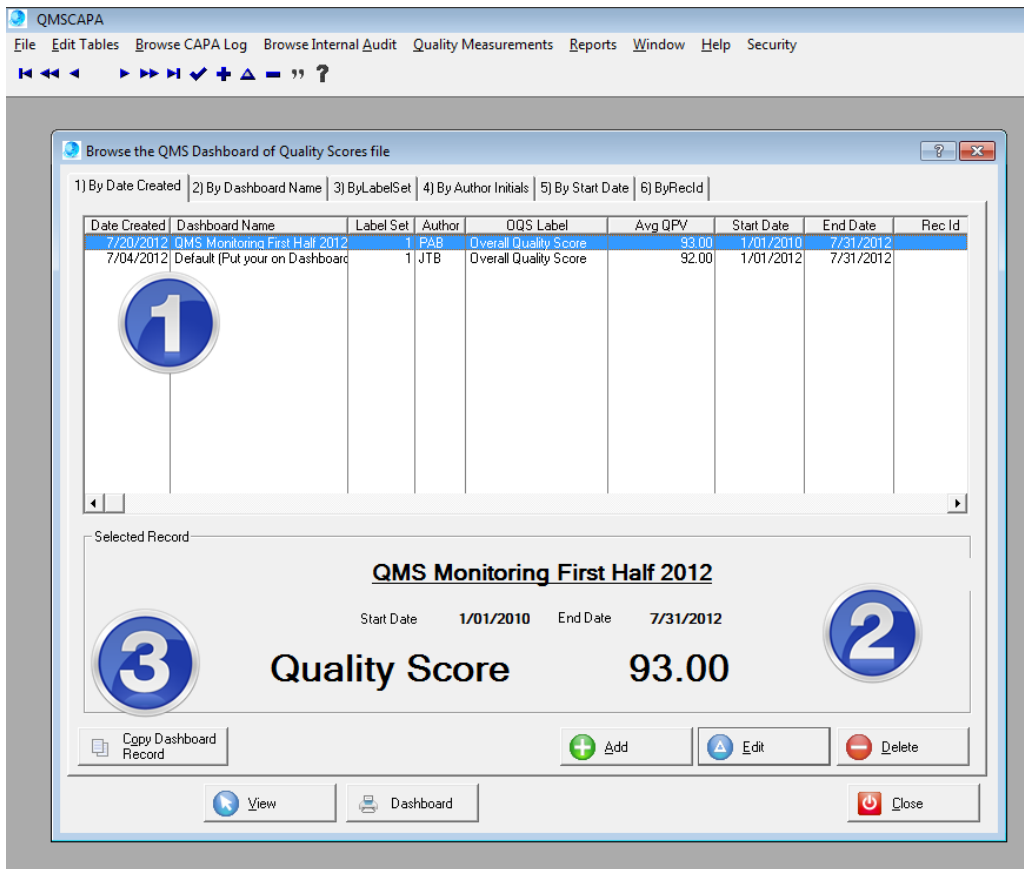

9.1 QMS Dashboard Table

The Dashboard Table displays the Dashboard data in descending order by the 'Date Created'.

Quality Management
Systems

1. The lower portion of the window display shows a snap shot of the highlighted Dashboard record.
2. The Copy Dashboard Record button provides an easy means to copy an existing record. For example, you may need to create a Quality Monitoring record for the first quarter and later copy the first quarter for the second quarter and then only change the date range for the quality measurements.

9.2 QMS Dashboard Form & Calculator

Quality Management Systems

The screenshot shows the QMSCAPA software interface. At the top, there is a menu bar with options: File, Edit Tables, Browse CAPA Log, Browse Internal Audit, Quality Measurements, Reports, Window, Help, Security. Below the menu bar is a toolbar with navigation icons. A data table is visible, showing columns for Date Created, Dashboard Name, Label Set, Author, OQS Label, Avg QPV, Start Date, End Date, and Rec Id. The table contains two rows of data.

The main window is titled 'Record Will Be Changed' and is divided into several sections:

- 1) Header Section:** Contains fields for Date Created (7/20/2012), Rec Id (3), and Date Saved (7/20/2012). It also includes a 'Label Set' dropdown menu and an information icon with the text: 'The settings in the Quality Label Set controls the Quality Calculations in this window.'
- 2) Dashboard Selection Section:** Includes a 'Selected Record' list on the left and a 'Dashboard Name' dropdown menu set to 'QMS Monitoring First Half 2012'. Below this are fields for Start Date (1/01/2010) and End Date (7/31/2012), and a 'Lock Dates' checkbox.
- 3) Metrics and Settings Section:** Contains a list of metrics with checkboxes for 'Include QPV' and a 'Lock Avg QPV' checkbox. The metrics are:

| Quality Metric | Value | Include QPV |
|-----------------------|--------|-------------------------------------|
| Customer Satisfaction | 85.00 | <input checked="" type="checkbox"/> |
| On-Time Delivery | 100.00 | <input checked="" type="checkbox"/> |
| Mfg/Production | 98.00 | <input checked="" type="checkbox"/> |
| Purchasing Quality | 93.00 | <input checked="" type="checkbox"/> |
| Sales Quality | 90.00 | <input checked="" type="checkbox"/> |
| Overall Quality Score | 93.00 | <input type="checkbox"/> |
- 4) Summary and Criteria Section:** Features a large display of the 'Overall Average Quality Score' as 93.00. To the right, there is a 'Criteria used for On-Time Delivery' section with checkboxes for 'SBD vs ASD', 'CDD vs ARD', 'Calc OTD', and 'Calc OTD plus Early'. Below this are several metrics:

| Metric | Value |
|----------------------|-------|
| Total Deliveries | 13 |
| SBD vs. ASD On-time | 11.00 |
| SBD vs. ASD Early | 2.00 |
| CDD vs. ARD | 1.00 |
| CDD vs. ARD Early | 1.00 |
| Net On-time Delivery | 13.00 |

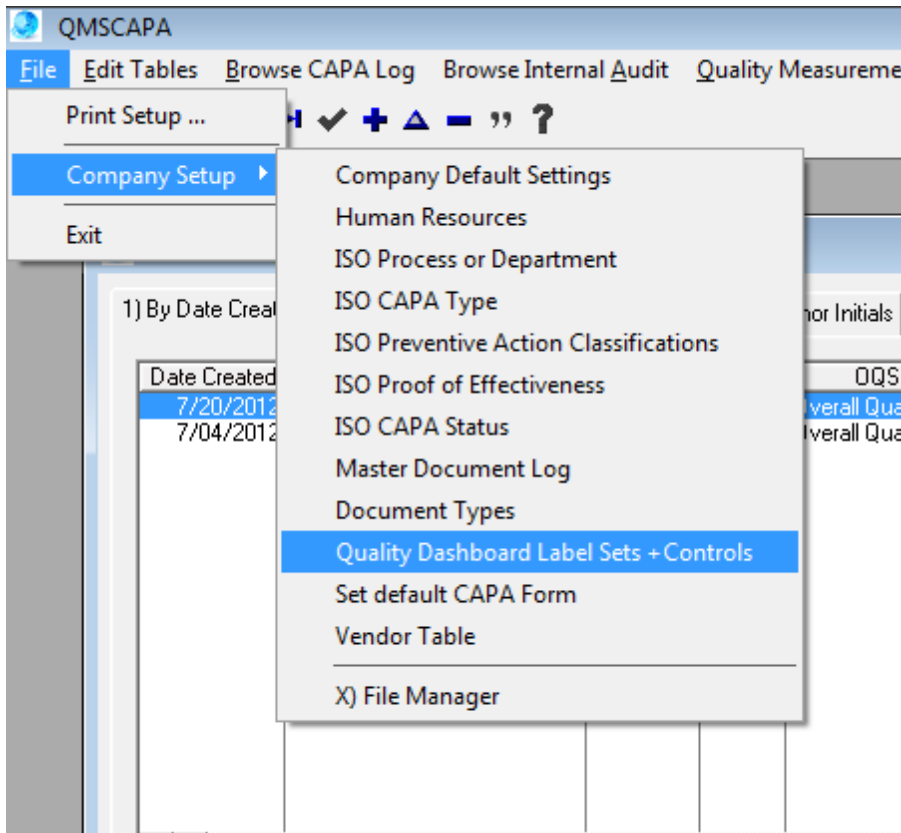

At the bottom of the dialog, there are three buttons: 'Refresh + Save', 'Save + Close', and 'Cancel'.

- 1) Choose a Label Set, which automatically populates the dashboard labels, the 'include QPV' settings, and the criteria for calculating on-time delivery settings.
- 2) The end-user can change the Labels on the Dashboard but not the formula of what must be calculated. The Q%V1, which means Quality Percentage Value # 1, always calculates Customer Satisfaction. Q%V2 always calculates on-time delivery. Q%V3 always calculates Mfg/Production quality. Q%V4 always calculates Purchasing quality. Q%V5 always calculates Sales quality.
- 3) Using the settings on the [Dashboard Label Sets](#) form window an end-user can select which quality metrics should be included on the dashboard.

- 4) Also, the criteria or formula for calculating on-time delivery is controlled by the [Dashboard Label Set](#) selected.

9.3 QMS Dashboard Label Sets

Quality Management
Systems

The QMS Dashboard Label Sets may be accessed from the File menu > Company Setup option menu.

QMSCAPA

File Edit Tables Browse CAPA Log Browse Internal Audit Quality Measurements Reports Window Help Security

1) By Label Set Id | 2) By Author Initials | 3) By Dashboard Name

| Label Set Id | Author | Dashboard Name | QM Label 1 | QM Label 2 |
|--------------|--------|----------------|-----------------------|------------------|
| 1 | JTB | Default | Customer Satisfaction | On-Time Delivery |

Record Will Be Changed

Default Values

Label Set Id: 1 Date Created: 7/04/2012 Date Saved: 7/20/2012

Author: JTB Location ID: 1

Dashboard Name: QMS Dashboard Default Settings

Criteria for On-Time Delivery:

SBD vs ASD CDD vs ARD

Calc OTD: Calc OTD plus Early.

| Default Function | Dashboard Quality Score Labels | Include the Value in the Over-all Average Score? |
|-----------------------------|--------------------------------|--|
| Customer Satisfaction | Customer Satisfaction | <input checked="" type="checkbox"/> Include QPV 1? |
| On-time Delivery | On-Time Delivery | <input checked="" type="checkbox"/> Include QPV 2? |
| Mfg/Production | Manufacturing/Production | <input checked="" type="checkbox"/> Include QPV 3? |
| Purchasing | Purchasing Quality | <input checked="" type="checkbox"/> Include QPV 4? |
| Sales | Sales Quality | <input checked="" type="checkbox"/> Include QPV 5? |
| Overall Quality Score Label | Overall Quality Score | |
| Description | | |

Note: An end-user may edit the Dashboard calculator labels. However, the function of each calculator metric is fixed to its intended purpose. For example, the first metric is for tracking 'Customer Satisfaction', therefore an end-user may elect to change the Dashboard label to 'Customer Sat. Score' but the changing of the label does not alter the formula's used for the calculation. Therefore, 'Customer Satisfaction' can only be measured in the first metric variable.

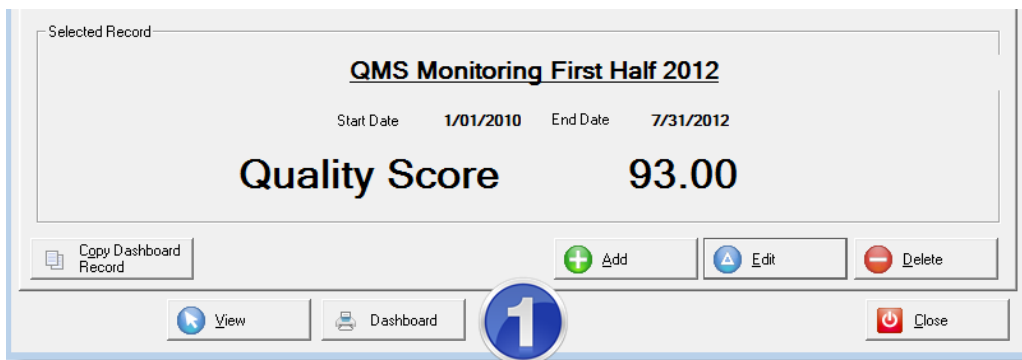

Save + Close Cancel

1) Criteria for On-Time Delivery controls the formula of how on-time delivery is calculated on the Dashboard.

- The check box SBD vs ASD means to calculate on-time delivery according to the Ship by Date (SBD) compared to the Actual Ship Date (ASD).
- The check box CDD vs ARD means to calculate on-time delivery according to the Customer Due Date (CDD) compared to the Actual Received Date (ARD).
- The check box Calc OTD means to only calculate the deliveries that were on-time and not early.
- The check box Calc OTD plus Early means to calculate the deliveries that were on-time, plus add the deliveries that were early.

- 2) An end-user may edit the Dashboard calculator labels. However, the function of each calculator metric is fixed and may not be changed from its intended purpose.
- 3) The check boxes with 'Include QPV # ...' determine whether or not the metric should be calculated on the Dashboard.

9.4 QMS Dashboard Report

Quality Management

11 Login and Security Settings

+1 800 644 2056
abci-consultants.com

About Security

Security will always be a balancing act. The opposite of security is convenience, foolproof security is almost impossibly inconvenient, while simplifying it almost always leads to lower levels of security.

When a user is created in QMSCAPA they can be classified into one of 3 possible Levels. The level with all the power is called a Supervisor. The Level with no power (in fact they will be denied access) is called No Access. In between, where a user has potentially limited power, they are allocated a Level called Operator. The difference between a Supervisor, and an Operator is obviously a significant one. Simply put, a Supervisor is allowed to change the security access rights of other Users. An Operator can not change either their own, or anyone else's, Access rights.

QMSCAPA may be distributed without its Security option enabled. When the Security option is enabled and the program is run the User is asked to enter a Login and a Password. A User's information is made up of a First Name, Last Name and Login code. When you first add a user the Password is automatically set to be the same as the Login code. After you have finished entering the first user, then you can use the Login, and Password (which will be the same at this point) to log in.

Three things must be done to implement security in QMSCAPA.

1. First, set up your user groups. Take some time to organize groups of users by department or job function.
2. Second, add your users. Assign every user a Login and Password.

3. Third, define screen access levels.

Related topics:

[Browse User Security
First User](#)

11.1 User Security Options

CAUTION: This feature should only be used by a System Manager.

Open the User Security Browse Table.

The User Security edit window allows specific security settings for Supervisors and Operators.

Open the Security Setting Access Control window to adjust specific access of Window Controls.

Select the [User Security] button control. The User Security window will open. At the bottom of this screen, press the button labeled User Group Details. You will see a list box, probably empty, so press the Insert button. You will see a form that asks for a User group name, and default access. Type in the name of the new user group and select "All Access" for the default access. Leave the Level set to Operator. The next User Group you enter will allow you to select a previously defined user group for a default access. User groups can inherit other user groups access privileges.

User Group Details

The Operator Browse screen is on the QMSCAPA Update User screen in the Company/Vendor section. Any Supervisor can add new Users using these built-in Operator Browse and Form Screens. On the Form are the following fields;

First name & Last name: These apply to the Operator.

Login: This is the Login Code the user will use to identify himself to the system. Note that the Supervisor cannot set the Password QMSCAPA for the user. The Password for QMSCAPA will default to be the same as the Login Code, after that only the user can change it.

Level: Set the User to be either another Supervisor, and Operator, or a

ABC ISO 
+1 800 644 2056
abci-consultants.com

User with No Access to this Area.

Default Access: If the User is an Operator, then you can set their Default Access. This is typically either All Access, or No Access, but it can also be set to the Login code of another Operator. In that case the new Operator will assume all the current Screen Security settings of the selected Default Access Operator.

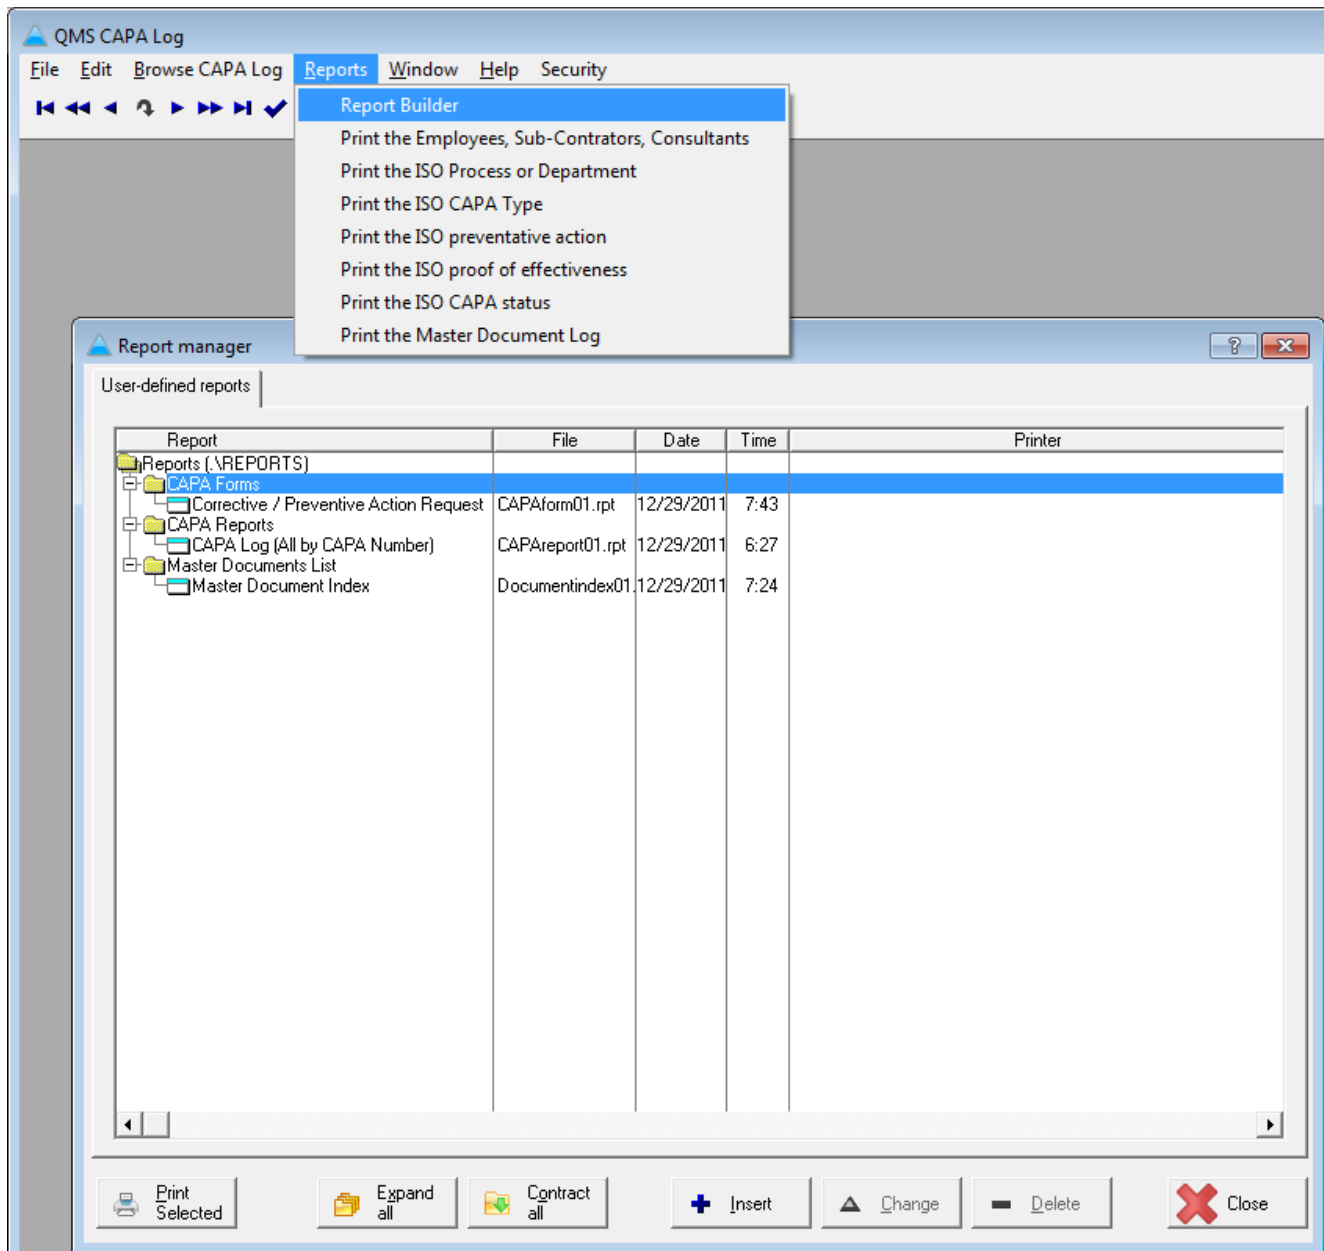

User Group: If the User is an Operator, then he can belong to a pre-defined User Group. For complete information on what User Groups are, read the section in this guide entitled Setting-up User Groups>Main.

12 Report Builder

A **Report Builder** is an end-user report writer tool for extracting information from a QMSCAPA database in a highly structured manner. Reporting styles can vary from simple columnar output to extravagant form letters and sales invoices. Some reports extract and/or manipulate data from a single database, while other reports may require several databases and complex formulae to generate information in the desired manner. (Report Builder is available with the Professional and Enterprise Licenses).

QMSCAPA contains menu options made available to the user for pre-defined reports. While these reports can usually fulfill the majority of end-user needs, times arise when a custom report has to be created. If the means to create/modify reports has not been included in an application, the programmer has to be hired to create the report for the user (usually at a substantial cost). The QMSCAPA [Report Builder](#) puts the power of creating/modifying reports into the users hands.

ABC ISO 
+1 800 644 2056
abci-consultants.com

As with any new tool there is a learning curve involved. However, a willingness to experiment can pay huge dividends to yourself and/or firm. You can create as many new reports as you want without paying a programmer to create them for you.

This **Report Builder** is an extremely powerful tool, comparable in features to software costing hundreds of dollars. Practically any type of report that you require can be created with this simple, yet highly effective tool.

12.1 What is a report builder?

A **Report Builder** is a tool for extracting information from a [database](#) in a highly structured manner. Reporting styles can vary from simple columnar output to extravagant form letters and sales invoices. Some reports extract and/or manipulate data from a single database, while other reports may require several databases and complex formulae to generate information in the desired manner.

Many computer applications have menu options made available to the user for pre-defined reports. While these reports can usually fulfill the majority of end-user needs, times arise when a custom report has to be created. If the means to create/modify reports has not been included in an application, the programmer has to be hired to create the report for the user (usually at a substantial cost). A report writer puts the power of creating/modifying reports into the users hands.

As with any new tool there is a learning curve involved. However, a willingness to experiment can pay huge dividends to yourself and/or firm. You can create as many new reports as you want without paying a programmer to create them for you.

This **Report Builder** is an extremely powerful tool, comparable in [features](#) to software costing hundreds of dollars. Practically any type of report that you require can be created with this simple, yet highly effective tool.

12.2 Features Of Report Builder

Report Builder can do a lot more than simply print columns of data. While that would certainly meet the needs of a lot of users, there are times when specific detail is necessary to accomplish your task. Here is

ABC ISO 
+1 800 644 2056
abci-consultants.com

ABC ISO 
+1 800 644 2056
abci-consultants.com

a short list of features you can use:

Accessing/Saving Report(s)

- Tree-styled Report Manager screen will help you to arrange your reports by means of classifying and [grouping](#) them by type and using several folders to store report files.
- You can create and manage an unlimited number of reports.
- Quickly create reports that are similar to an existing report by opening a file, then saving the report to a new file name.
- You can use Windows styled long filenames when saving reports.

QMSCAPA Report File Names

The QMSCAPA Report Builder will attempt to save your new reports with a name similar to "RPT00001.RPT." The second report that you save will be named "RPT00002.RPT" and the third will be named "RPT00003.RPT" and so on for additional reports. Therefore, end-users are recommended to **save report file names** using the automatic schema with the built-in serialized report file name.

If you makes changes to one of the QMSCAPA standard reports which are installed with the application, then you should save the changes using "**SAVEAS**" and let QMSCAPA suggest the appropriate name with the serialized naming schema as described above. If you save your changes with the same name as used by QMSCAPA to store its standard reports, then your changes will be overwritten each time QMSCAPA is upgraded.

Optionally, you may create your own report file names. If you elect to save your reports with your own naming convention, for example "MyQMSCAPAReport01" then it is not necessary to add the "**RPT suffix**" at the end of the file name. The Report Builder will append the suffix to your custom file name. Once again, end-users should not use the QMSCAPA report file naming convention to save new or modified reports.

Data Creation/Manipulation

- Simultaneous processing of several data tables joined in an integrated structure
- Effective and high speed filters for records using any available fields from applications database file(s), including expressions and functions of the Report Builder's native programming language

- Sort data using any available fields, including expressions and functions of the Report Builder's native programming language
- You can easily build complex [expressions](#) with help of the built in Data Dictionary. The Dictionary contains all the field names, functions, operators, built-in variables and user defined total variables/calculated fields which are allowed for use in an expression. The Dictionary also shares a tree-style hierarchical structure.
- Supports end-user creation of total variables of type Sum, Counter, Average, Minimum, Maximum, Evaluate. Total variables can be reset on the end of appropriate sorting group as well as on the end of each page. These variables can be set up to be evaluated at the start of report, at the each record, at the end of a sorted group, at the end of page, at the end of report.
- Supports end-user creation of "Calculated fields". They are very similar to "Total variables" but always use the Evaluate type and never being reset. You can accomplish very complicated computations using any number of Total variables and Calculated fields.
- Print the current date and time on a page. The Picture can change the format of a date or time field to any desired format. For example, you can change 02/21/00 to read "21 February, 2000" at report runtime.

12.3 Report Builder - User Interface

User Interface

- The **report formatter** or painter uses a word processing-styled interface, with buttons commonly found for formatting text (right align, left align, center align, etc)
- Supporting report sections ([bands](#)): Page header, Report header, Group break, Group header, Detail, Group footer, Report footer, and Page footer. Each band can contain an unlimited number of **Frames** to represent information.
- [Frame](#) contents may be a text string(s), or a formula. This is similar to Microsoft Excel usage: if the frame contents begins with the equal sign "=" then it means the rest is the formula to evaluate. In that way you can reference the only one variable as well as the expression containing as many variables and functions as you want.
- Use borders around the Frames to make them stand out. For example, you can place a border around dollar totals at the bottom of reports. You can also use all the Frames with borders and join Frames side-by-side to get grid-style report. Frame borders may have varying thickness and color. Also the whole frame can be filled by selected color.
- You may select a font typeface, size, style and color for the whole

ABC ISO 
+1 800 644 2056
abci-consultants.com

report or report section as well as for individual frame. Use different fonts and font types to make key data stand apart from other data.

- You can select multiple Frames at the same time for repositioning or alignment operations.
- Frame contents are placed and aligned both vertically and horizontally.
- Print the current page number as well as the total number of pages on each page header/footer.
- Print the number of database records printed on the current page (useful for page footer information).
- Ability to export report pages in WMF format to Microsoft Word for Print Preview, Edit, Save as *.doc format file, Printing purposes, etc.
- Add graphics to a report that are stored on your computer.
- Save one or more versions of a report for unique output and/or results.

QMSCAPA Report File Names

The QMSCAPA Report Builder will attempt to save your new reports with a name similar to "RPT00001.RPT." The second report that you save will be named "RPT00002.RPT" and the third will be named "RPT00003.RPT" and so on for additional reports. Therefore, end-users are recommended to **save report file names** using the automatic schema with the built-in serialized report file name.

If you makes changes to one of the QMSCAPA standard reports which are installed with the application, then you should save the changes using "**SAVEAS**" and let QMSCAPA suggest the appropriate name with the serialized naming schema as described above. If you save your changes with the same name as used by QMSCAPA to store its standard reports, then your changes will be overwritten each time QMSCAPA is upgraded.

Optionally, you may create your own report file names. If you elect to save your reports with your own naming convention, for example "MyQMSCAPAReport01" then it is not necessary to add the "**RPT suffix**" at the end of the file name. The Report Builder will append the suffix to your custom file name. Once again, end-users should not use the QMSCAPA report file naming convention to save new or modified reports.

12.4 Databases

As simple to use as this report builder is, there are some **database** fundamentals that you should be comfortable with in order to get the most out of this powerful tool. It is one thing to blindly type information

into a computer, but empowering yourself as to how a database program really works will greatly enhance the reports that you create.

A database is nothing more than a collection of information that is somehow related. A common phone book is a wonderful example of a database. A basic definition of a phone book would be a collection of names, addresses, phone number(s) for people and businesses in one physical area (usually a city, or a common area code number). So, a database would be all the names, addresses and phone numbers contained in a phone book.

A database file is comprised of two new terms: database records and database fields. going back to the phone book once again, each persons name listed in the phone book would be a database record - it contains all the information for one person or business (their name, address, phone number(s), etc). The next name shown in the phone book would be a separate database record, and so on.

A database record is made up of database fields. Using the phone book again as an example, we would have separate database fields for the following information:

- Individuals/business name
- Street address
- Phone number

A database can have only one field, or can have hundreds of fields - whatever it takes to store all the information required for one database record entry.

A phone book is usually sorted on the name of the individual/business, beginning with the number 0, and ending with the letter Z. This type of sort is known as ASCENDING sequence. If you started at the back of a phone book and worked your way to the front (going from the letter Z to the number 0) this sort is called DESCENDING sequence. Sorting a database requires the creation of a second type of file known as a database index, which can also be called a database key.

A database index is a file used by a database application to change the appearance of information stored by the database. Going back to the phone book example - every day the phone company creates phone numbers as people and businesses move into the city. Their name(s) are obviously not going to be in alphabetical order when the clerk creates their new phone number - a person named Jones may be first, then Joe-Bob's Barbeque is next, then Alpha-Beta Drugs may be third, and so on. Without a way of sorting this information a printed phone

directory would be a total mess - names would jump around the alphabet! The index file's job is to regain some structure and order to the information being input into the database.

A database index file can be created using one database field, or several database fields. These file(s) are normally opened when the database is opened, and as each database record is added/deleted an identical action is performed on the index file. For the phonebook example, the desired sort would be the individual/business name to be sorted in ascending alphabetical sequence. The fieldname used for the index would be the individual/business name. If your phone company were really customer-oriented they could perhaps create section(s) in their phone book that were sorted on the street address - a new index created on that database field would be created/used to print this new section of the phone book.

Index file(s) are most commonly used in browse screens (a screen where all the database records are displayed in columns, sorted alphabetically for easy location of information) and reports.

Index file(s) are also used to relate two or more database files together, which store different pieces of information that belong together. This type of database application is known as a relational database - two or more database file(s) relate to each other by means of a common database field, and an index file that links the two separate files together.

An example of a relational database could be your bank account. When you first joined your bank you filled out a form with your name, address, work history, etc. The clerk typed this information into the computer, handed you a bundle of blank checks and thanked you for joining their bank. All this "initial" information is stored in a database. As you start writing checks to pay for things a transaction is created for the date it was written, the dollar amount, the date the transaction was posted to your account, the check number, etc. These transactions are stored in a separate database file.

In the example above, we have one database that stores customer information (name, address, etc) and another database that stores transactions for each check cashed. In both database files is a field that contains the account number, and an index file is created for each database on this field. The two database files are related to each other by these index files created on the account number.

Not all database applications require a relational setup - if the information being tracked is simple then a single database file will contain all the data being monitored. However, all business type database systems rely on the relational database structure in order to

keep track of a large quantity of information. Relational databases greatly reduce the amount of information being kept in database files, which keeps the size of the database file(s) small and increases the speed of the program in retrieving data.

This Report Builder can create reports from single database programs or relational database programs.

12.5 Fields

A database record is made up of database fields. Using the phone book again as an example, we would have separate database fields for the following information:

- Individuals/business name
- Street address
- Phone number

A database can have only one field, or can have hundreds of fields - whatever it takes to store all the information required for one database record entry.

12.6 Database filters

A **database filter** enables you to extract information from database file (s) that you want to print on the report. The ability to use filters in database programs has always been one of the strongest features of database applications (dBase, Foxpro, Access, etc). While they can be a little confusing at first, if you understand some basic concepts of how to create a database filter you will find them to extremely helpful in creating useful reports.

Filters do not change any information contained in database file(s); they don't copy information to another file either. A filter simply "hides" information that you don't want to see, which explains why they are called "Filters". No matter how many times you create or use a database filter, you are guaranteed that they will NEVER harm your database information. Hopefully this will give you the confidence to try creating filters for various purposes.

Reports may be filtered on the Report Property level and/or on a Report Band level. In the example below, the **Report Properties** are found inside the Report itself under the FILE > REPORT PROPERTIES menu

ABC ISO 
+1 800 644 2056
abci-consultants.com

ABC ISO 
+1 800 644 2056
abci-consultants.com

option.

The **REPORT PROPERTIES** contains the master **Page layout** information, plus a field to store the **Report Builder Menu information and a Record filter**.

Related Topic: [Expressions and Formulas](#)

12.7 Expressions and Formulas

Expressions

An expression is made up of two types of components: operands and operators. Operators perform an operation (such as addition, subtraction, etc.) on one or more operands of the expression. Operands are the components on which operations are performed. Operands either contain or return a value. Constants, data dictionary columns, memory variables, and functions are examples of operands. An operand can be made up of more than one component, such as a function and its parameters.

The [Frame](#) Editor lets you choose operators and operands, and then insert them into the Statement line.

The sections below lists all the components used in Clarion expressions.

Math Operators

- + Plus sign: Adds two operands together.
- Minus sign: Subtracts one operand from another.
- * Asterisk: Multiplies one operand by another.
- / Slash: Divides one operand by another.
- % Percent sign: Returns the remainder from a division operation (modulus division).

- ^ Caret: Raises one operand to the power of the other.
- () Parentheses: Groups components together within an expression.

Logical (Boolean) Operators

- = Equal: Evaluates whether one expression is equal to the other.
- < Less Than: Evaluates whether one expression is less than the other.
- > Greater Than: Evaluates whether one expression is greater than the other.
- <> Not Equal: Evaluates whether one expression is not equal to the other.

ABC ISO 
+1 800 644 2056
abci-consultants.com

>= Greater or Equal: Evaluates whether one expression is greater than or equal to the other.

<= Less or Equal: Evaluates whether one expression is less than or equal to the other.

AND Connects two logical expressions together. For an expression containing an AND to be true, both expressions of the AND must be true.

OR Connects two logical expressions together. An expression containing an OR is true if either expression of the OR is true.

XOR Connects two logical expressions together. An XOR expression is true if either expression is true, but not both.

NOT Reverses the evaluation of an expression.

~ Reverses the evaluation of an expression.

String Operators

& Ampersand: Appends one text string to another.

Operands

Data ~Includes data dictionary columns, global, and local memory variables.

Functions ~All of the built-in functions of the Clarion language. These functions all perform some operation on parameters (other operands) and return a value.

User ~Any FUNCTION in your application. These functions perform some operation on parameters (other operands) and return a value.

Constant Text ~You can type constant text surrounded in single quotes ('A') on the Statement line.

Constant Number ~You can type constant numbers on the Statement line. Constant numbers can be represented in any valid format, such as Decimal (1 or 1.2345), Scientific Notation (22e4), Binary (0101b), or Hexadecimal (1AFFh).

Example Expressions

| | |
|--|---|
| Lastname & ', ' & FirstName & variables | !concatenated string constants |
| ABS(Amount) * 100 constant | !function, numeric variable & constant |
| TaxCode = True AND Amount > .25 | !Boolean with variables & constants |

12.8 Report Formatter Screen

Whenever you create a new report or modify an existing report you will be using a report formatter or "painter" to place item(s) in the desired location. The screen is very easy to use, with a toolbar of commonly used commands, a pulldown menu, and use of the right mouse button to modify item(s) on the screen. Here is a sample screen "painter"; place the mouse button over an item - if the mouse cursor changes to a hand you can left click the mouse to see what the item does.

12.8.1 Adding Text Frame

After text to a frame is very easy; it is the default action for a new frame. As soon as the frame is added to the report band you can immediately start typing:

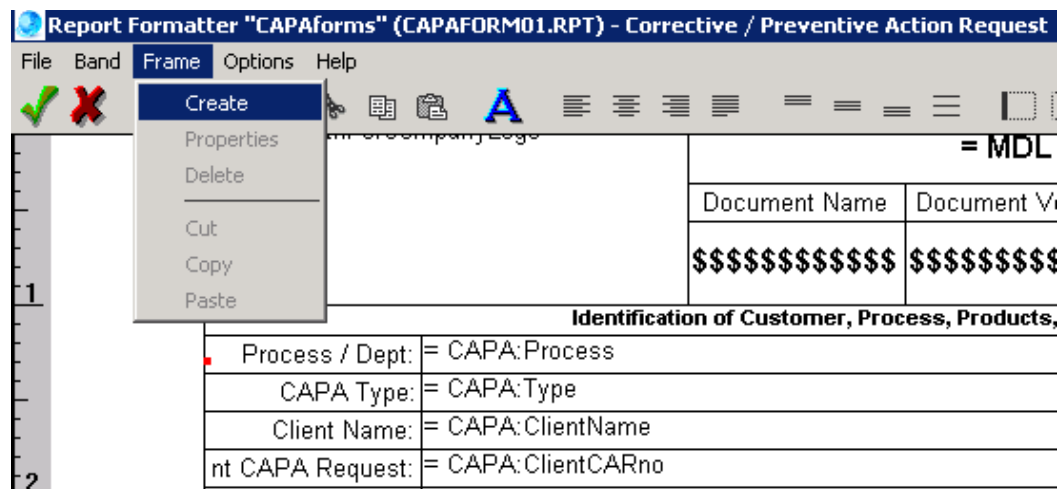

The above screen capture shows a report band with a Page Header report band; created inside is one frame, and the text string "Sample Report Title" has been entered. As you type information into the entry field for 'Contents'

ABC ISO
+1 800 644 2056
abci-consultants.com

the screen is updated to reflect the information.

You can right click on the frame to change the characteristics of the information (in this case, the text string "Sample Report Title") will be printed.

Because the frame contains only a text string (Sample Report Title) you don't have to worry about the Picture tab, or the Picture pushbutton, since you are typing the text string as you want it printed.

12.8.2 Frames

Frames are used to mark the boundaries of an object placed in a report band. A better explanation in "laymans terms" would probably be best described as a "box that will contain something". Frames are usable on certain report bands that you add to a report.

ABC ISO
 +1 800 644 2056
abci-consultants.com

To define a new frame, you will:

- Left click inside the report band that you want something to be printed; this will select the report band to receive the empty frame
- Right click the mouse to display a popup menu; from this menu select 'New Frame'

A new empty frame is now displayed inside the report band where you had previously left clicked the mouse:

As shown above an empty frame was placed inside the Page Header Report Band; red blocks outline the frame, indicating that you can stretch any of the corners to meet your printing size requirement. You can also

drag the empty frame to a different location inside the report band by left clicking inside the empty frame, then drag the empty frame to the desired location. When dragging the empty frame the border will turn completely red - release the left mouse button after moving the frame to set it's position.

A useful ruler bar to aid in positioning frames for the report. You can toggle the ruler bar style between the English system and Metric system by selecting the main menu option OPTIONS, then METRIC SYSTEM. If a checkmark is displayed to the left of the menu entry the ruler bar is displayed using the metric system, and vice versa.

Once you have moved and/or resized the frame you need to define what you want printed in this location. A frame can contain many things:

- A database field used in the application
- A text string (such as a report header, column header, etc)
- A calculated field that is generated at runtime
- A page counter
- The current date or time
- Total fields (such as total expenditure, dollar total, etc)

Frames can also contain MULTIPLE items - this is handy when you want to format database information to look a certain way. Here are some examples of combining multiple items inside a frame:

- Two or more fields: CUS:Fname &' '&CUS:Lname [The &' ' places a blank space between the first and second name]
- Two or more fields; remove empty space at end of each field: clip(CUS:Fname) &' '&clip(CUS:Lname)
- Two or more fields; highly formatted: clip(CUS:Lname) &', '&clip(CUS:Fname)
- Fields and text: '* ' & clip(ITE:Description) &' '*'

Notice that the function clip() was used with text information (remember to ALWAYS surround any text information with the ' symbol). Any of the report builder functions may be used to format database information (such as the Upper() and Lower() functions).

To change the contents of a frame and/or it's properties you will use the Report Formatter Frame Edit Box.

Related Topic: [Expressions and Formulas](#)

12.8.2.1 Frame Properties

In many ways, a **FRAME** is very much like a **CELL** inside a spreadsheet. However, a **FRAME** may be placed at any position inside a **BAND** and is not constrained by a ROW or COLUMN in a spreadsheet. This dialogue box allows you to modify the appearance of information stored inside a frame. You can display this popup window by double clicking on a frame, or right click on the frame and select from the popup menu the choice titled Properties:

You can change any aspect of the frame contents by using this dialogue box. Here is a breakdown of the various options:

- **Contents:** If you are going to use the frame to contain text you can simply type it into this entry field. If you want the frame to contain database information click on the Dictionary button to select a database field, or alternatively format the information using the built in functions. You can modify the contents at any time by selecting the frame and re-editing.
- **FRAME TYPES:** A frame type can be **CUSTOMARY, MAIL MERGE OR IMAGE FILE.**
- **CUSTOMARY FRAME:** Use the CUSTOMARY FRAME for most fixed length data fields and field report labels.
- **MAIL MERGE:** Use the MAIL MERGE FRAME to place multiple fields with various sizes into a particular BAND.
- **Contents - Image File Name:** Include the Path and the Image file name (frameproperties.jpg or logo.bmp)
- **Picture:** If using database information inside the frame you can use a "picture" to modify it's appearance. Optionally, for large text fields leave the picture token blank.
- **Appearance Group:**
 1. **Multiline Text** (Use this option if you want to wrap text content inside the FRAME. The contents of the field will conform to the size of the FRAME.
 2. **Auto Resize Bottom** (Use this option to flow text from fields with large contents that may vary in size. This feature works best when the FRAME is placed alone on the last line of the BAND. Therefore, the FRAME may be set to .20 but with this feature enabled the FRAME will automatically adjust to a height that is needed for the inflow of text.
 3. **ROTATION ANGLE:** Use the **ROTATION ANGLE** on a CUSTOMARY Frame to show field variable data or text on a slant.
- **Align Horizontal:** A drop list of different positions that the frame contents are aligned horizontally inside the frame.
- **Align Vertical:** A drop list of different positions that the frame contents are aligned vertically inside the frame.
- **Left Margin:** Define in increments of 0.5mm the gap between the edge

of the frame and it's contents from the left edge of the frame.

- Right Margin: Define in increments of 0.5mm the gap between the edge of the frame and it's contents from the right edge of the frame.
- Top Margin: Define in increments of 0.5mm the gap between the edge of the frame and it's contents from the top edge of the frame.
- Bottom Margin: Define in increments of 0.5mm the gap between the edge of the frame and it's contents from the bottom edge of the frame.
- Between Margin:
- Border Color: Displays a standard Windows color selection box to choose a color for the border drawn around the frame.
- Left Border: A checkbox that allows for displaying (checkbox is check marked) or not displaying (checkbox is empty) a border on this side of the frame. The default setting for the report builder is to display a solid black border around the contents of the frame.
- Right Border: A checkbox that allows for displaying (checkbox is check marked) or not displaying (checkbox is empty) a border on this side of the frame. The default setting for the report builder is to display a solid black border around the contents of the frame.
- Top Border: A checkbox that allows for displaying (checkbox is check marked) or not displaying (checkbox is empty) a border on this side of the frame. The default setting for the report builder is to display a solid black border around the contents of the frame.
- Bottom Border: A checkbox that allows for displaying (checkbox is check marked) or not displaying (checkbox is empty) a border on this side of the frame. The default setting for the report builder is to display a solid black border around the contents of the frame.
- Border Width: This is a spin box with a range of 0-9 which changes the border line width.
- Font: Displays a standard Windows dialogue box to change the font characteristics of the frame contents.
- Fill Enable: A checkbox allowing you to fill in a frame with a solid color. When check marked the button to the left of the checkbox is made available to select a color from a standard Windows color selection dialogue window.
- Save: Save changes made to the selected frame.
- Cancel: Abandon all changes made to the selected frame.

12.8.3 Report Bands

There are 8 types of report bands, plus [frames](#), that can be defined in a report:

1. **Page Header** - Your report can contain only one page header. This report band is printed at the top of the output on each generated report

page.

2. **Report Header** - Your report can contain only one report header. This report band is printed at the top of the output on only the FIRST generated report page.
3. **Sorting Band** - You can have multiple Sorting Band details on a report. A sorting band may contain it's own header, footer and/or additional breaks. A sorting band is the mechanism for SORTING a report.
4. **Group Header** - This band is printed at the top of each page when the group break value has changed.
5. **Detail** - You can have multiple DETAIL bands in a report. A detail band is responsible for retrieving database information required for the report and printing the data onto the report.
6. **Group Footer** - This band is printed at the bottom of each page when the group break value has changed.
7. **Report Footer** - This band is printed at the bottom of the last generated page in the report.
8. **Page Footer** - This band is printed at the bottom of each page in the generated report.

12.8.4 Sorting Bands

This band is used to print a header above a group. Let's examine a real world situation for using a sort band header.

Let's use a mailing list as an example. Your organization has members all over the United States in each of the fifty states. When your mailing list prints you want the output to be nicely formatted with a title above each state to be make locating people in a specific state very quick and easy. An example output without a group header may resemble:

```
AL  Bob McKinley
AL  Chuck Connors
AL  David Spinley
AZ  Alan Sockworth
AZ  Frank Sputz
AZ  Henry Rollins
```

And an example output with a fancy sort band header:

```
_____
State: AL
_____
      AL  Bob McKinley
      AL  Chuck Connors
      AL  David Spinley
```

State: AZ

AZ Alan Sockworth
AZ Frank Sputz
AZ Henry Rollins

Obviously a group header can be as simple or fancy as required. Different font types and colors can be used to help separate groups of data as needed. Aside from being far more visually appealing for the user, they also aid in locating data that is grouped together much more efficiently.

A group header can contain a mixture of text and database field information. Use the frame characteristics dialogue box to help you build the group header.

12.8.5 Group Band Properties

Sample Output:

Notice that the Group Footer was printed only after the state code changed from FL!

USER TIP: To force the FL data to begin printing on a new page click on the **Explicit Page Overflow** checkbox [] **Before Band Printing, which forces a New Report Page.**

ABC ISO 
+1 800 644 2056
abci-consultants.com

12.8.6 Concatenation Symbol

Concatenation is a fancy word that means "join together"; it is most often used in the computer programming world, which is why you've probably never heard of it.

The ampersand symbol (&) is used to join together one string field or string variable to another. The length of the resulting string is the sum of the lengths of the two strings. Numeric data types may be concatenated with strings or other numeric variables or constants. In many cases, the CLIP() function should be used to remove any trailing spaces from a string being concatenated to another string.

Examples: clip(NAM:Lastname) & ', ' & clip(NAM:Firstname)

ABC ISO 
+1 800 644 2056
abci-consultants.com

'\$' & ITM:UnitCost

Related Topic: [Expressions and Formulas](#)

12.9 Dictionary

The dictionary is the "heart" of the report builder - it contains information on all the database fields used by your program, as well as internal variables and functions that you can use to customize your output. The **dictionary** may be accessed through a **FRAME**. Here is a sample dictionary:

ABC ISO 
+1 800 644 2056
abci-consultants.com

Shown above is a sample dictionary. The dictionary uses an expandable "tree" format to access the different types of information that can be placed inside a frame. The tree above is shown in collapsed form for a better overall view. To gain insight into what the different dictionary categories are, left click on one of the following items in the above screen capture:

- Processed Files
- Functions
- Built-In Variables
- Standard Operators
- Standard Functions
- Calculated Fields
- Gather Totals

A dictionary stores all the data used in this application in an easily accessed format. It also provides access to powerful tools for manipulating data required for fancier reports. You can even create new variables to contain data that is extracted at report generation time!

12.9.1 Dictionary - Built in Variables

As shown above there are 4 available built-in variables that can be used in a report. Double left click an entry to select the choice to insert the value into the Contents window of the FRAME properties entry field.

ABC ISO 
+1 800 644 2056
abci-consultants.com

12.9.2 Dictionary - Calculated Fields

The screen capture above shows a new calculated field being added to

ABC ISO 

the dictionary. A new variable named "TotalCost" is being created that will contain the sum of two database fields (INV:Quantity + INV:Cost). The evaluation process is performed at the end of the page.

+1 800 644 2056
abci-consultants.com

The new variable was created by clicking the blue '+' button after highlighting Calculated Fields.

Calculated fields can be looked upon as temporary storage in the computers memory to perform calculations on one or more database fields. This is primarily used for (but not restricted to) calculating invoice totals, inventory balances, etc. By changing the Picture you can have the output modified to better suit your needs. For example, if you are calculating a dollar total you could use the picture @N\$-10.2 to display a dollar sign in front of the calculated field.

You can also change where the evaluation process occurs. There are 4 different methods to how fields are calculated:

- On the start of the report
- On each record
- On the end of the report
- On the end of the page

Related Topics: [Expression and Formulas](#)

12.9.3 Dictionary - Funtions

These functions are different than those found in the Standard Functions. These functions are designed by the programmer especially for this pc application. The screen above may be totally blank, with no functions developed at all. Or, it could contain a dozen or more specialized functions that perform a specialized task.

ABC ISO 
+1 800 644 2056
abci-consultants.com

The above screen shows four functions available to this application. You could select one of these functions for your report from this dictionary location.

Some examples of different functions that a programmer could create and store here would be:

- Convert a text string to a propercase statement
- Calculate true cost of an item, to include it's sales tax
- Calculate tariff costs for outbound sales
- Convert a standard date (mm/dd/yy) to a julian formatted date

(yyyyddd)

12.9.4 Dictionary - Gather Totals

The screen capture above shows a new variable (Totalcost) being created that will contain the sum of two database fields (PRO:QuantityInStock and PRO:Cost). The total is evaluated at the end of the report. This option is used primarily to obtain and print grand total (s) from information contained in the database.

The new variable was created by clicking the blue '+' button after highlighting Grand Totals.

If you need totals printed on each page the option 'Page Totals' will better suit your purpose, as it will gather the information when each page is generated and properly insert the value on the output.

ABC ISO
+1 800 644 2056
abci-consultants.com

12.9.5 Dictionary - Processed Files

This section of the Dictionary will be the most heavily used section by you - it contains references to all the databases and their fields. Depending on your application you may have only one database listed under "Processed Files" or many entries. The screen capture below shows three database files (Inventory History, Vendors and Products):

The above screen capture shows the Processed Files section of the dictionary. In this example there are three databases in this application:

- Inventory History
- Vendors
- Products

For each database you can expand the "tree" to view the database fields that it is made up of. The above example shows the Inventory History tree expanded to show it's database fields. The description for the field is shown under the database name - it is a more "english" looking name for the database field name, which is shown in the second column titled 'Name'. Notice that the database fields shown in the Name column have a prefix (INV:); this prefix is used to identify the database field at it's lowest level. Prefixes allow a programmer to use the same database field name in other database(s) used by this application.

The Processed Files section of the dictionary is used to select database

ABC ISO
+1 800 644 2056
abci-consultants.com

field(s) for use in frames, calculated fields, etc. To select a field simply double click the desired field to insert it into the frame or calculated field.

12.9.6 Dictionary - Standard Functions

The language used to create this Report Builder has some extremely useful "functions" that programmers use to generate applications. Some of these functions are made available to you to use with your reports.

A function could be described as a means of converting something to something else. Data is manipulated using a function to generate a desired result. Kind of like a car going through a carwash - it looks one way going in, and another way coming out.

Functions are broken into four "groups":

Here is a more detailed breakdown of the categorized function types:

String Functions

- ALL() - Returns a text string that replicates itself a defined number of times. For example, ALL('A',5) would return the text string 'AAAAA'.
- CAPITALIZE() - Returns a text string with the first letter in uppercase and the remainder in lowercase.
- CHR() - Returns the ANSI character from an ASCII code. For example, CHR(122) would return 'z'
- CLIP() - Returns a string with the trailing spaces removed. Commonly used to properly format names and addresses into a more aesthetic appearing text string; multiple database fields are combined together using the concatenation symbol (&) to form a formatted string. For example, the database field ADR:City that contains the city name 'Tucson' could be combined with the ADR:State field that contains 'Az'. Because the ADR:City database field has 30 spaces allocated to it, and only 6 positions were used for 'Tucson', you would normally have 24 blank spaces:

Tucson Az

not exactly appealing! Using the CLIP() function and the concatenation symbol you

can convert this to: Tucson, Az

EX: CLIP(ADR:City) & ', ' & CLIP(ADR:State)

Note that there is a blank space after the comma to "push" the state over one

position to avoid crowding the comma character.

- DEFORMAT() - Returns a string that contains the unformatted characters of a numeric string. For example DEFORMAT('999-53-

9954') returns 999539954

- **FORMAT()** - Returns a formatted string; knowledge of the PICTURE command is mandatory to make best use of this function. For example `SSN = FORMAT(Emp:SSN,@P###-##-####P)`, which would properly format the database field EMP:SSN to a standard social security number.
- **INLIST()** - Returns the position of an item in a comma delimited list. For example, `INLIST('D','A','B','C','D','E')` returns a value of 4
- **LEN()** - Returns the length of a string. For example, `LEN('Scott Daughtry')` would return a value of 14.
- **LOWER()** - Returns the lowercase version of a string. For example `LOWER('SCOTT Daughtry')` would be returned as 'scott daughtry'.
- **NUMERIC()** - Returns a true or false. If a string contains only numbers a true is returned. For example `NUMERIC('123')` would be true, and `NUMERIC('1,23')` would be false.

SUB() - Returns a portion of a string. You define where the starting and stopping positions are in the string. For example, `SUB('Scott Daughtry', 1, 5)` would extract positions 1-5 of the string, returning 'Scott'. `SUB('Scott Daughtry', 7, 3)` extracts 'Dau' - the starting position is 7, and the next 3 positions are extracted from that starting point. You can also work backwards on a string by assigning a negative starting position. For example, `SUB('Scott Daughtry', -1, 3)` would return 'try'.

- **UPPER()** - Returns an uppercase version of a text string. For example, `UPPER('scoTT')` is returned as 'SCOTT'.
- **VAL()** - Returns the ASCII character numeric equivalent for an ANSI entry. For example, `VAL('A')` would return 65.

Mathematical Functions

- **ABS()** - Returns an absolute value from an expression. The absolute value of a number is always a zero. For example, `C = ABS(A-B)`. C would contain the absolute value of the difference of B subtracted from A
- **INRANGE()** - Compares a numeric expression for an inclusive range of numbers. Returns a value of true if the scope is met, and false otherwise. For example, `INRANGE(variablename, 1, 5)` would check if the variablename is with the numbers 1-5, and return true if so. The starting number is 1, and ending number is 5.
- **INT()** - Returns an integer value from a numeric expression. For example, `INT(8.5)` would return a value of 8.
- **LOGE()** - Returns the natural logarithm. The natural logarithm of a value is the power to which e must be raised to equal that value. The value of e used internally for these calculations is 2.71828182846. For example `LOGE(2.71828182846)` returns 1; `LOGE(1)` returns 0
- **LOG10()** -Returns base 10 logarithm. If the value of the expression is

zero or less, the return value will be zero. The base 10 logarithm is undefined for values less than or equal to zero. The LOG10 procedure returns the base 10 logarithm of a numeric expression. The base 10 logarithm of a value is the power to which 10 must be raised to equal that value. For example, LOG10(10) returns 1; LOG10(1) returns 0

- RANDOM() - Returns random integer. Returns a random integer between the low and high values, inclusively. The low and high parameters may be any numeric expression, but only their integer portion is used for the inclusive range. For example, RANDOM(22, 80) would return a random number between the numbers 22 and 80.
- ROUND() - Returns a rounded number. For example, ROUND(5163, 100) would return the rounded number of 5163+100 (which is 5200); ROUND(657.50,1) returns 658; ROUND(51.63594,.01) returns 51.64
- SQRT() - Returns the square root of a number.

Trigonometric Functions

- SIN() - Returns the trigonometric sine of an angle measured in radians. The sine is the ratio of the length of the angle's opposite side divided by the length of the hypotenuse. For example, returns the trigonometric cosine of an angle measured in radians. The cosine is the ratio of the length of the angle's adjacent side divided by the length of the hypotenuse. For example, sineAngle = SIN(45 * 3.142498712
 - COS() - Returns the trigonometric cosine of an angle measured in radians. The cosine is the ratio of the length of the angle's adjacent side divided by the length of the hypotenuse. For example, cosineAngle = COS(45 * 3.142498712)
 - TAN() - Returns the trigonometric tangent of an angle measured in radians. The tangent is the ratio of the angle's opposite side divided by its adjacent side. For example, TanAngle = TAN(45 * 3.142498712)
- ACOS() - Returns the inverse cosine. The inverse of a cosine is the angle that produces the cosine. The return value is the angle in radians. p is a constant which represents the ratio of the circumference and radius of a circle. There are 2p radians (or 360 degrees) in a circle. For example, acos = ACOS(45 * 3.142498712)
- ASIN() - Returns the inverse sine. The inverse of a sine is the angle that produces the sine. The return value is the angle in radians. p is a constant which represents the ratio of the circumference and radius of a circle. There are 2p radians (or 360 degrees) in a circle. For example, asine = ASIN(45 * 3.142498712)
- ATAN() - Returns the inverse tangent. The inverse of a tangent is the angle that produces the tangent. The return value is the angle in radians. p is a constant which represents the ratio of the circumference and radius of a circle. There are 2p radians (or 360 degrees) in a circle. For example, TanAngle = ATAN(45 * 3.142498712)

Date/Time Functions

- TODAY() - Returns the operating system date as a standard date. The range of possible dates is from January 1, 1801 (standard date 4) to December 31, 2099 (standard date 109,211). You can use a picture command to change the appearance of the return value. For example, `cToday = format(TODAY(), @d01B)`
- CLOCK() - Returns the current time based upon your pc bios time.
- DATE() - Returns a standard date for a given month, day, and year. The month and day parameters do allow positive out-of-range values (zero or negative values are invalid). A month value of 13 is interpreted as January of the next year. A day value of 32 in January is interpreted as the first of February. Consequently, `DATE(12,32,97)`, `DATE(13,1,97)`, and `DATE(1,1,98)` all produce the same result. The century for a two-digit year parameter is resolved using the default "Intellidate" logic, which assumes the date falls in the range of the next 20 or previous 80 years from the current operating system date. For example, assuming the current year is 1998, if the year parameter is "15," the date returned is in the year 2015, and if the year parameter is "60," the date returned is in 1960. For example, `HireDate = DATE (Hir:Month,Hir:Day,Hir:Year)`; `FirstOfMonth = DATE(MONTH(TODAY()),1,YEAR(TODAY()))` would compute the first day of month
- DAY() - Returns day of month. Computes the day of the month (1 to 31) for a given standard date. For example, `OutDay = DAY(TODAY())` to get the day from today's date; `DueDay = DAY(TODAY()+2)` to calculate the return day
- MONTH() - Returns the month of the year (1 to 12) for a given standard date. For example, `PayMonth = MONTH(DueDate)` to get the month from the date
- YEAR() - Returns a four digit number for the year of a standard date (1801 to 9999). For example, `YEAR(today())`
- AGE() - Returns a string containing the time elapsed between two dates. The age return string is in the following format: 1 to 60 days - 'nn DAYS'; 61 days to 24 months - 'nn MOS'; 2 years to 999 years - 'nnn YRS'. For example, `nAge = AGE(EMP:Birthday, TODAY())` would compare the database field EMP:Birthday against the computer date to return the persons age.

12.9.7 Dictionary - Standard Operators

The language used to create this Report Builder allows you to use 'operators' to create and/or compare values stored in your database file (s). Operators are broken into two different groups:

ABC ISO 
+1 800 644 2056
abci-consultants.com

Arithmetic

Addition - Add two variables together to produce a value. The addition sign (+) is used.

Subtraction - Subtraction one variable from another to produce a value. The minus sign (-) is used.

Multiplication - Multiply one variable against another to produce a value. The asterisk symbol (*) is used.

Division - Divide one variable into another to produce a value. The slash character is used (/).

Exponentiation - Raises one variable to the value of a second variable. The carat symbol (^) is used.

Modulus Division - Returns the remainder of one variable divided by another variable. The percentage character (%) is used.

Logical

Choose() - This function is used to perform a logical evaluation and return a value based upon the result. When a condition is evaluated to true the first return value is returned. If a condition is evaluated to false the second return value is returned. For example, CHOOSE(1 > 2, 'A', 'B') would return 'B'; CHOOSE(INV:Sex = 'M', 'Male', 'Female') would return the text string 'Male' if the database field INV:Sex contained a value of 'M'.

And - A boolean operator; used to combine 2 or more logical statements together. Used when you need/want multiple logical expressions to equal TRUE in order for something to occur. For example: INV:Sex = 'M' AND INV:State = 'Az' would require the database field INV:Sex to equal 'M' AND the INV:State database field to equal 'Az' for a value of true to be returned. If either database field did not contain these values then a return value of false is returned. The expressions are evaluated from left to right; if a value of false is returned then the subsequent expressions are skipped over, since a value of false has already been reached. If the INV:Sex database field did not contain a value of 'M' then the INV:State field wouldn't be processed at all - a value of false has already been returned. If the INV:Sex database field contained an 'M', but the INV:State database field contained something other than 'Az', then a value of false is returned, since both items must return a value of true. You can a very long expression with the AND operator. For example: INV:Sex = 'M' AND INV:State = 'Az' AND INV:Birthdate > '01/01/60'.

Or - A boolean operator; used to combine 2 or more logical statements together. Used when a condition can evaluate to a value of false but processing is still desired. For example: INV:Sex = 'M' AND Inv:State = 'Az' OR INV:State = 'Ak' would evaluate INV:Sex; if it equals a 'M' the INV:State field is evaluated. If it contained 'Az' an overall return value of true is reached. If it didn't contain 'Az' it is then checked for a value of 'Ak'. If it did, a an overall value of true is reached.

Not - A boolean operator. Used in conjunction with the Greater Than,

Equal To or Less Than operators. For example, INV:State NOT = 'Az'; INV:Age NOT < 45; INV:Income NOT > 30000.

Xor - A boolean operator. Used when an expression can evaluate to true on one side of the equation, but not both. For example: A XOR B; true is returned if A is true OR B is true, but not both.

Greater Than - The symbol (>) is used for this operator. When you want the left side of an equation to return a value of true. For example, INV:Quantity > 5 would return a true if the INV:Quantity database field was greater than 5.

Lesser Than - The symbol (<) is used for this operator. When you want the right side of an equation to return a value of true. For example, INV:Age < 15 would return true if the database field INV:Age is less than 15.

Equal To - The symbol (=) is used for this operator. When you want an exact match in an equation for a value of true to be returned. For example, INV:State = 'Az' would return a value of true if the database field INV:State contained 'Az'

Not Equal To - The symbol (<>) is used for this operator. When you want a value of true returned when a variable does NOT contain a particular value. For example, INV:State <> 'Az' would return a value of true when it did not contain 'Az'

Greater Than Or Equal To - The symbol (>=) is used for this operator. When you want a value to be equal to or greater than something. For example: INV:Sold >= 325 would return a value of true if the INV:Sold database field was equal to or greater than 325.

Less Than Or Equal To - The symbol (<=) is used for this operator. When you want a value to be equal to or less than something. For example, INV:Sold <= 325 would return a value of true if the INV:Sold database field was equal to or less than 325.

Standard operators can be used to build complicated expressions when you want to "drill down" to highly specific data (which is normally the case). Make sure that the most important criteria is placed first that would (in theory) eliminate the majority of data when the database is scanned. This will speed up the remainder of the operational string when they are executed. Some expression examples:

```
EMP:Sex = 'M' AND LOC:State = 'Az' OR Loc:State = 'Nv' AND  
EMP:Haircolor = 'Brown'
```

```
STO:Location = 'Iowa' AND PAR:Vendor = 'Hasbro' AND PAR:Onhand  
<= 100
```

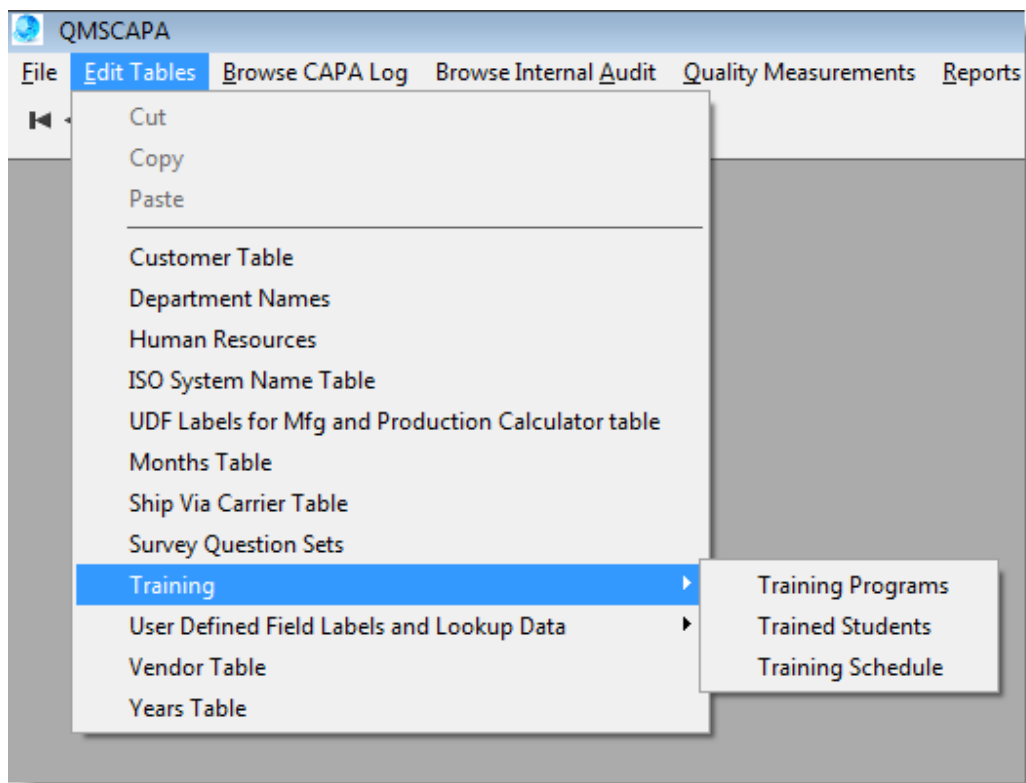

```
SAL:Total = INV:Itemprice * SAL:Quantity * SAL:Salestax
```

13 Training

QMSCAPA provides a method of ...

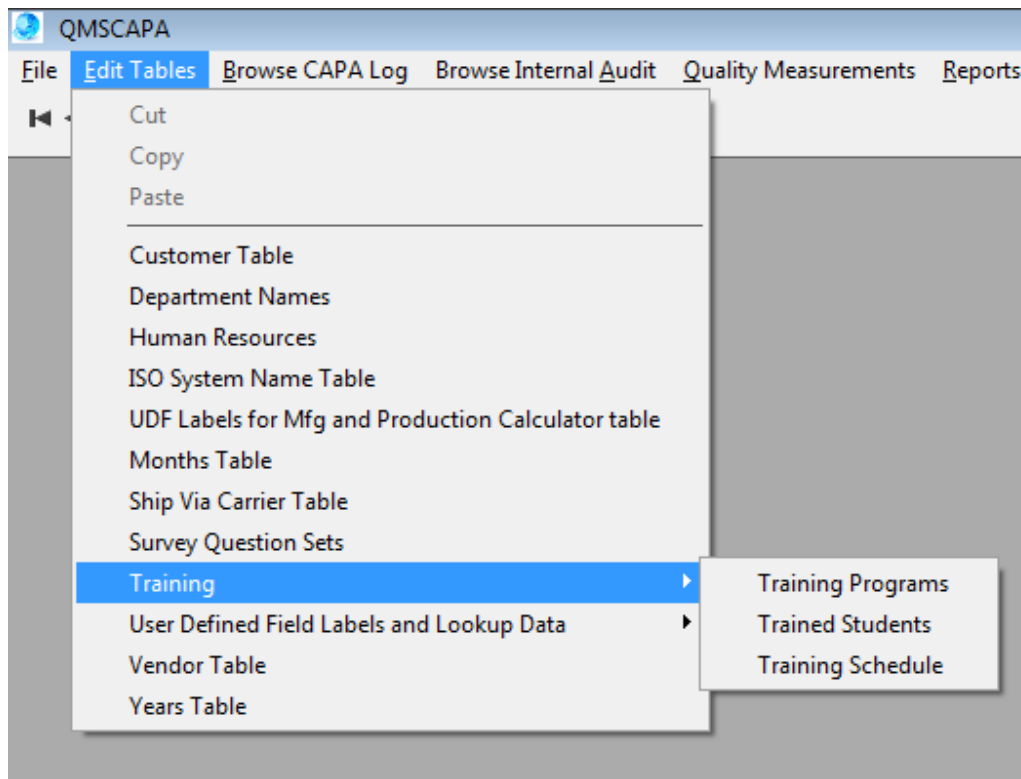

- Creating a personnel training plan;
- Documenting mgmtremgtraining programs;
- Recording Student training;
- Recording training effectiveness.

ABC ISO
+1 800 644 2056
abci-consultants.com

- The **Training Programs** menu option opens a table of training courses and training elements (components of the course).
- The **Trained Students** menu option opens a table of personnel that have been trained on specific Training Programs.
- The **Training Schedule** menu option opens a table of the Training Programs, which have been scheduled for specified students.

13.1 Training Programs

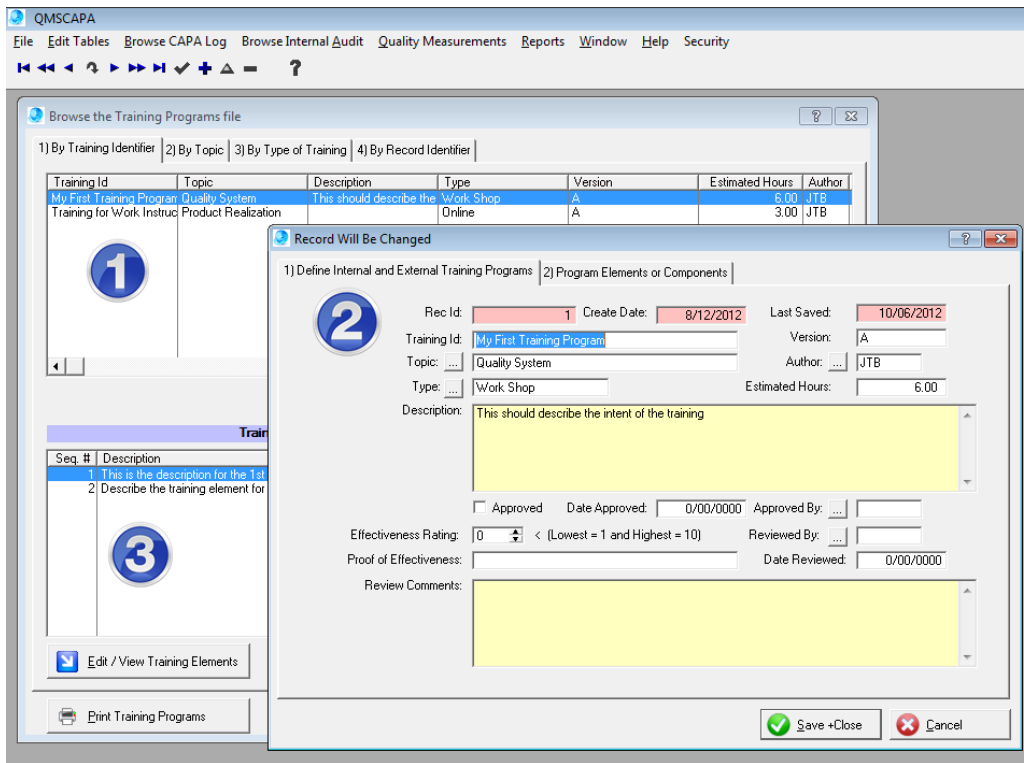

ABC ISO
+1 800 644 2056
abci-consultants.com

To create or edit a Training Program select ..

Edit Tables > Training > Training Programs

- 1) Section (1) shows a browse table of Training Programs. Training Programs is intended as a generic term for training course, training workshop and, or training class.
- 2) Section (2) shows a window form for adding or editing a Training Program.
- 3) Section (3) shows a browse table of the [Training Elements](#) that are part of or components of the Training Program. For example, a training course may be extended over multiple weeks and each weekly class may be defined within the training element.

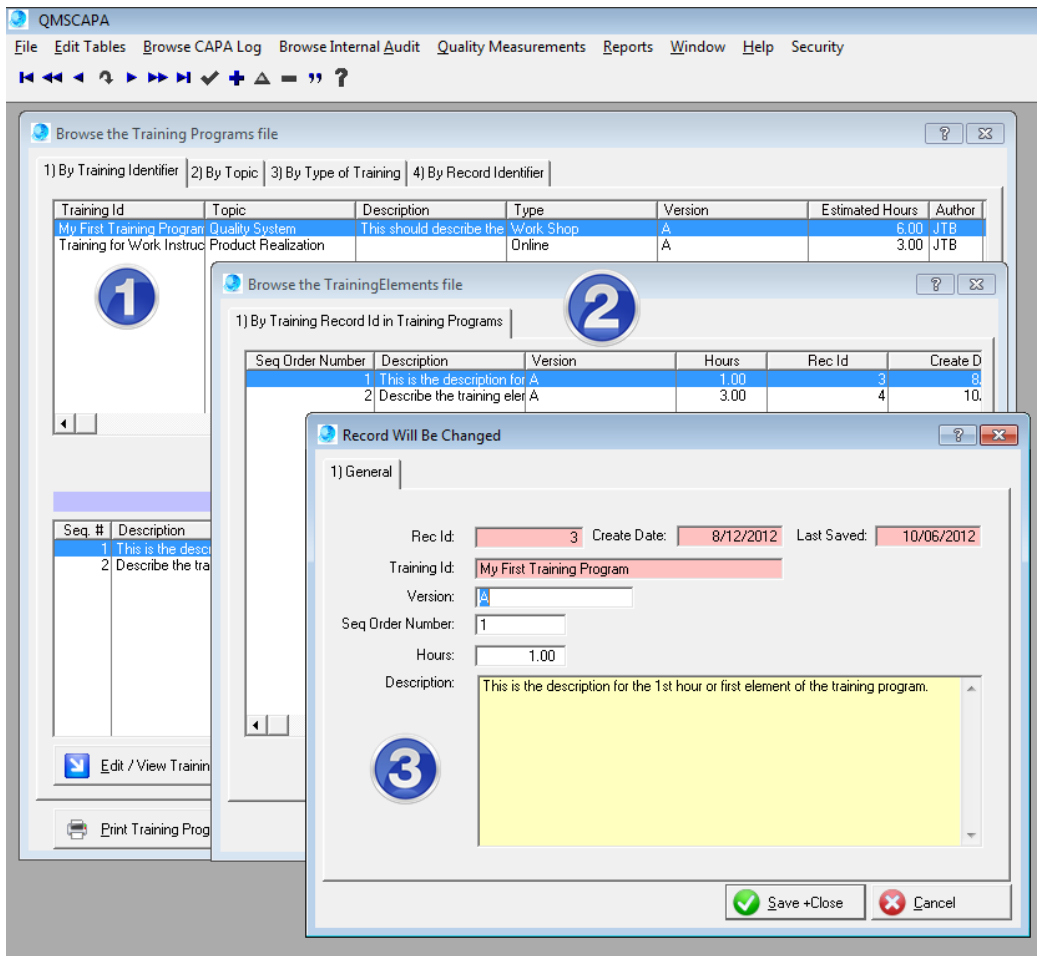

13.1.1 Training Program Elements

Training Elements are sub-components of a Training Program. Training Elements may be used to represent:

- Workshops
- Chapters
- Days
- Assignments
- You name it!

- Section (1) shows a browse table of Training Programs.
- Section (2) shows a browse table of Elements of a highlighted record in the Training Programs browse table.
- Section (3) shows the window form for adding or editing a training element.

ABC ISO
+1 800 644 2056
abci-consultants.com

13.2 Trained Students

To create a Training Record select ..

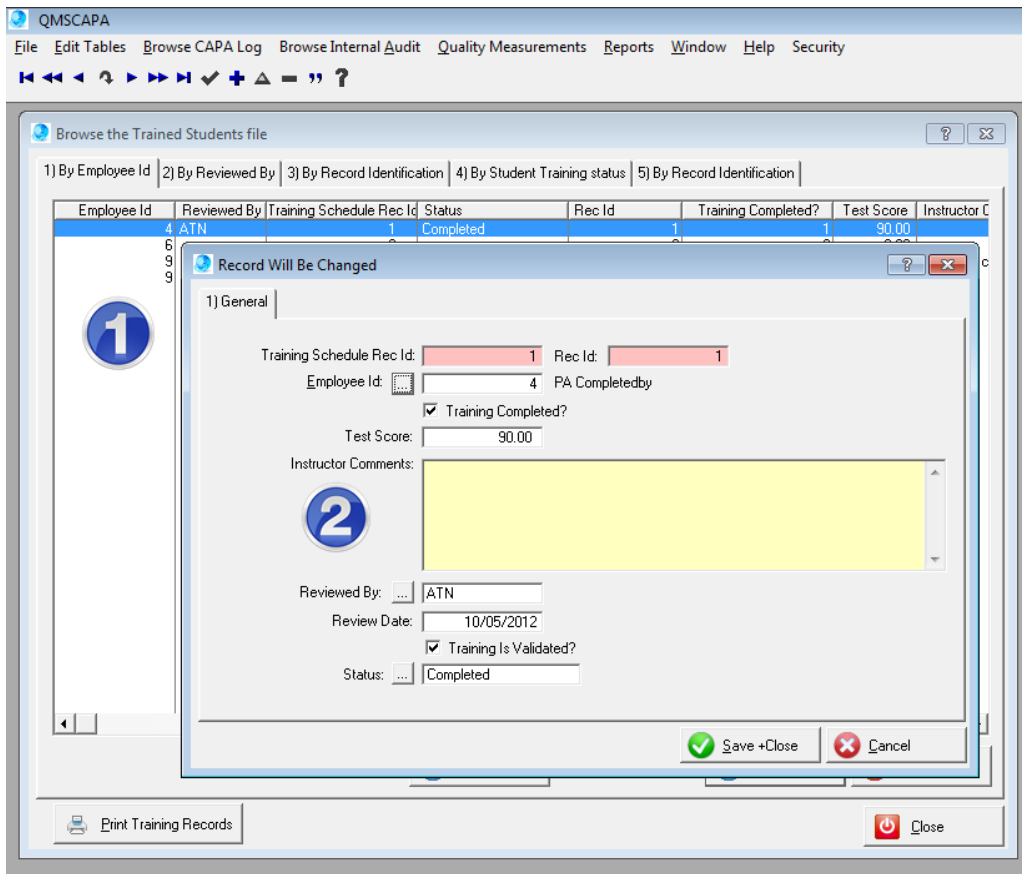

Edit Tables > Training > Trained Students

ABC ISO
 +1 800 644 2056
abci-consultants.com

The Trained Students browse table is designed for enrolled students and students who complete a Training Program.

- 1) Section (1) shows a browse table of enrolled students.
- 2) Section (2) shows a window form for adding and editing *training records*.

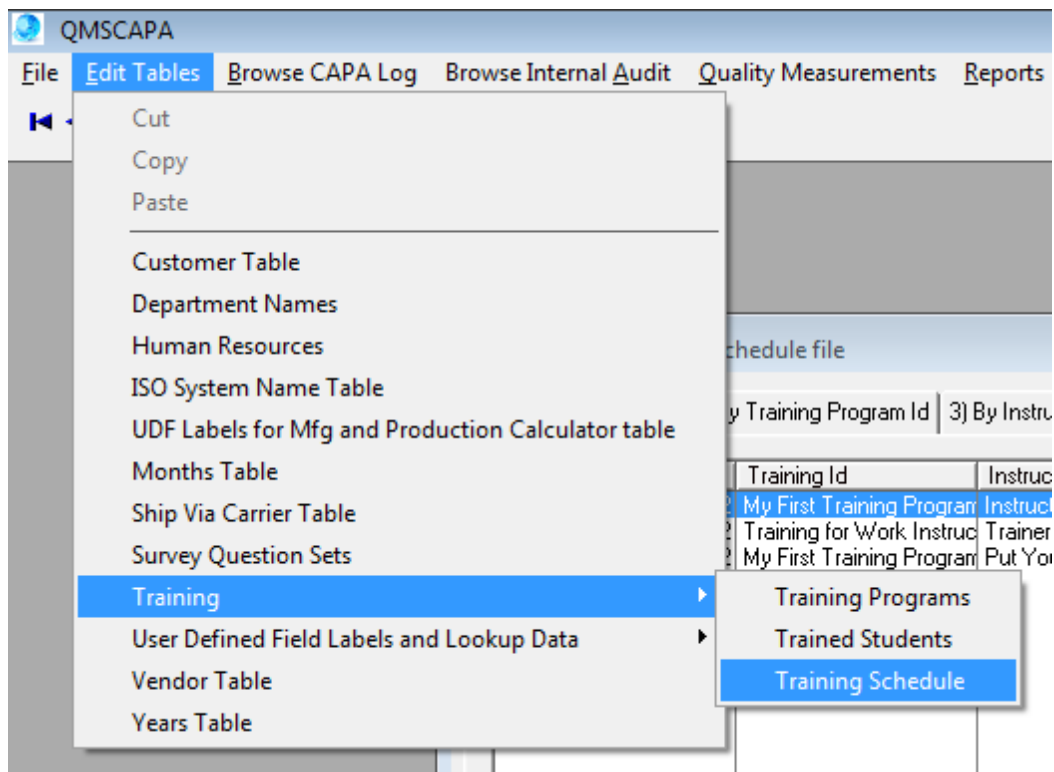

13.3 Training Schedule

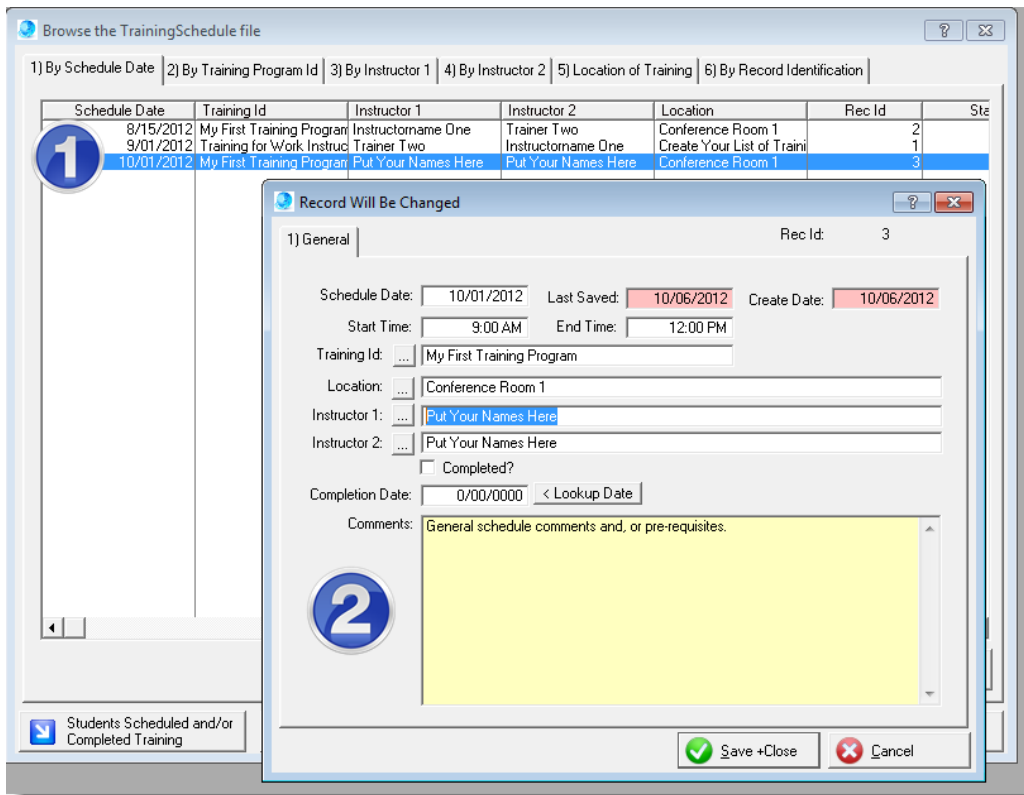

To schedule a Training Program select ..

Edit Tables > Training > Training Schedule

ABC ISO
 +1 800 644 2056
abci-consultants.com

- 1) Section 1 shows the browse table for Training Programs, which have been scheduled.
- 2) Section 2 shows the window form for recording or scheduling a Training Program.

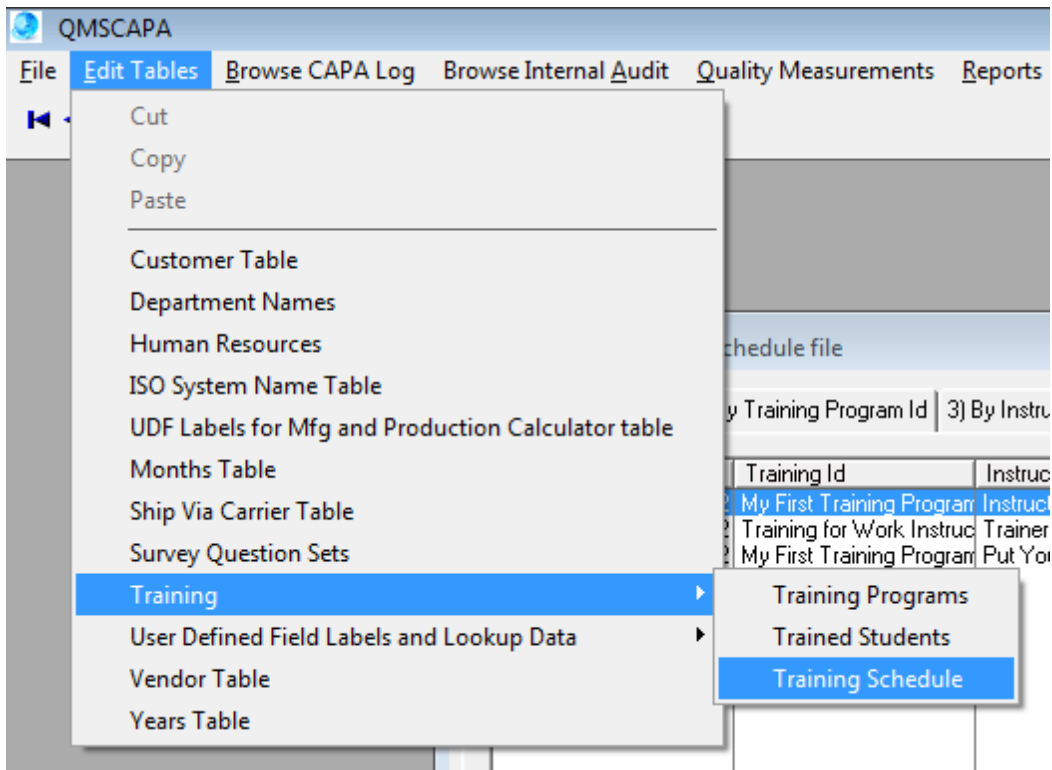

13.3.1 Adding Students to a Schedule

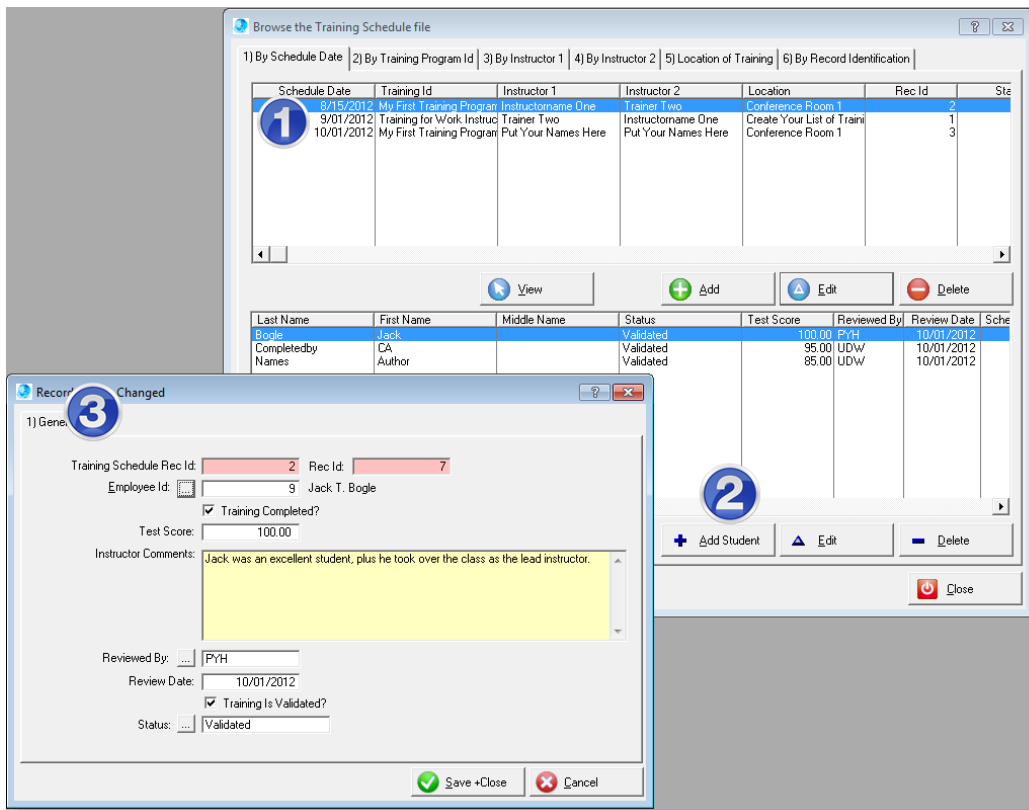

To enroll students and schedule a Training Program select ..

Edit Tables > Training > Training Schedule

ABC ISO
 +1 800 644 2056
abci-consultants.com

- 1) Section 1 shows the browse table for Training Programs, which have been scheduled by the date scheduled and Training Id.
- 2) Section 2 shows the browse table for Students that have been enrolled into the Program that is highlighted in table (1). Use the [Add Student] button to record a student enrollment.
- 3) Section 3 shows the window form for the enrolled student and the status of their training outcome.

14 Utilities

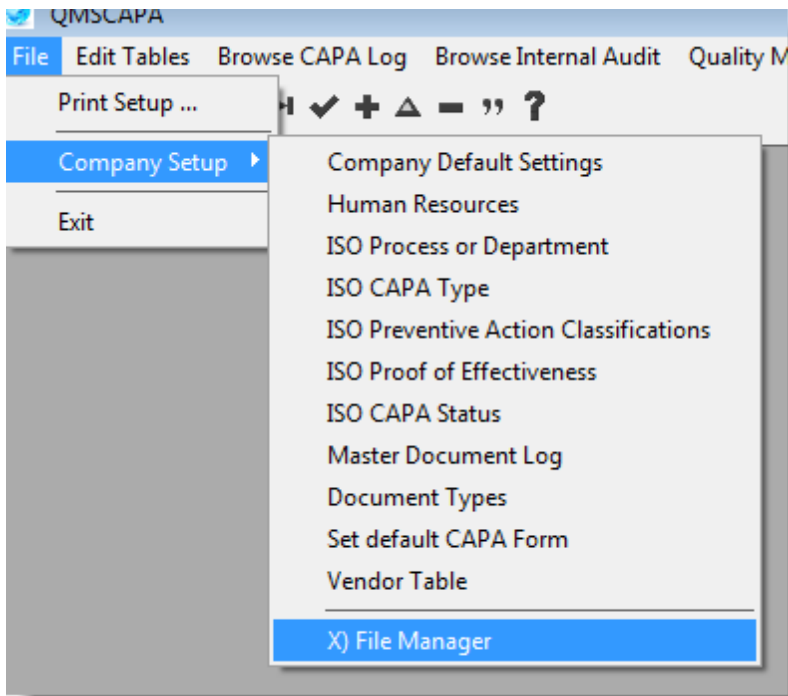

14.1 File Manager (Internal)

The internal FILE Manager, which is embedded within QMSCAPA™, is designed to keep QMSCAPA™ database files working in top form.

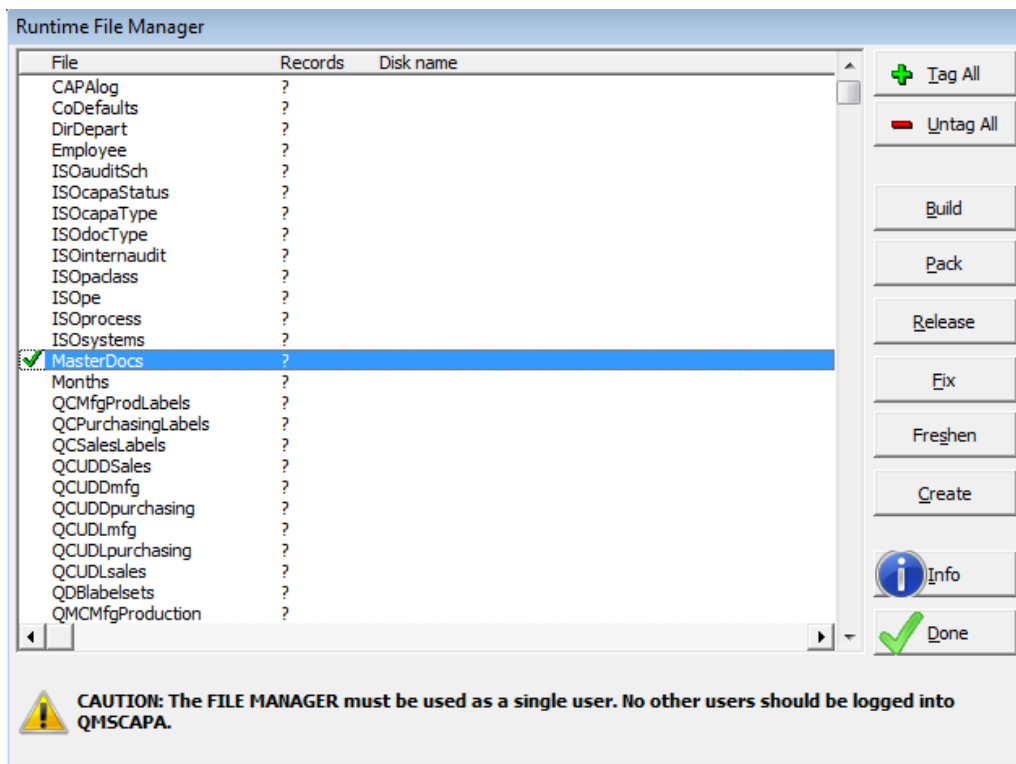

ABC ISO
 +1 800 644 2056
abci-consultants.com

In most cases if QMSCAPA™ encounters a file error the 'error message' to the user will include the file name. Write down the file name and go to the File Manager as shown below. You may need to restart the application.

USER TIP: Use the FILE MANGER as a single user only!

Select the appropriate file with the offending error by using the mouse pointer select or deselect a specific file. Left click on the file name places a check-mark to the left of the file name. First use the Freshen button to

correct the file problem. Other options are described below:

- [Tag All] is used to select all files.
- [UnTag All] is used to deselect all files.
- [Build] is used to 'Re-index' the selected file(s).
- [Pack] is used to remove previously 'deleted' records from the selected file(s).
- [Fix] is used to repair the selected file(s). Fix must only be used if the file doesn't come right with Freshen. Don't use Fix on working files, as it can sometimes corrupt them. Fix is your last resort.
- [Freshen] is used to create a new file and copy all the old records out the old file and put them in the new file. Freshen is the best for fixing files, for getting rid of deleted records, and re-building keys all in one. This effectively removes all duplicate entries (which might be causing the Build to fail) and also can act as an effective fixing of possibly corrupted files.
- [Info] is to look-up the quantity of records in the selected file(s) and show the File Path.
- [Create] is used to create a non-existent file.
- [Done] closes the File Manager.

Some database Build, Freshen and Repair functions may need to be done using the standalone [File Manager \(External\)](#).

14.1.1 File Access Error

If QMSCAPA ENCOUNTERS FILE ACCESS Error message (QMSCAPA may or may not close down?)

Unfortunately, magnetically stored data files can get tweaked and or damaged due to break-downs of hardware and network interruptions.

1. Make sure that you are the only user in QMSCAPA when you attempt to correct a file access problem.
2. Identify the offended file name, which typically appears in a window similar to the one that appears to below.

3. Navigate to FILE > COMPANY SETUP > FILE MANAGER.

ABC ISO
+1 800 644 2056
abci-consultants.com

4. Locate the offended file name in the File Manager browse table and mouse-click or check in the empty space left of the file name.
4. Click on the [FRESHEN] button, which will launch a utility application that will compare the file and attempt to recover and/or correct it. The process may take a few moments to a few minutes depending upon the size of the file and the type of corruption that may have occurred. Please wait until the process is complete.
5. Resume using QMSCAPA to learn if the problem reoccurs. If the problem persists return to the File Manager and repeat the steps above but using the [FIX] button.

14.2 File Manager (External)

The External FILE Manager is a standalone application that must be installed in the same directory as your QMSCAPA™ database files (filename.tps). Therefore, to install **FM3QMS.exe**, most Windows computers will require:

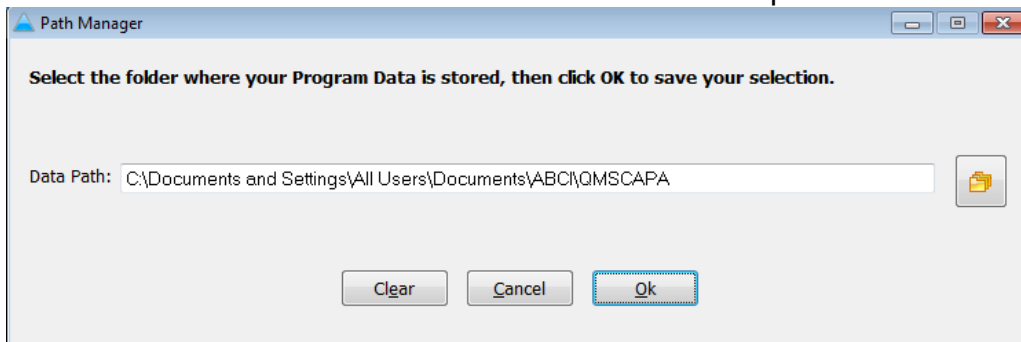

1. An Administrative User login to the computer or server where the QMSCAPA™ database files (filename.tps) are located.
2. All QMSCAPA users should be logged out of the application and all of the databases should not be in use.

In most cases if QMSCAPA™ encounters a file error the 'error message' to the user will include the file name. Write down the file name and go to the File Manager as shown below. You may need to restart the application.

USER TIP: Use the FILE MANGER as a single user only!

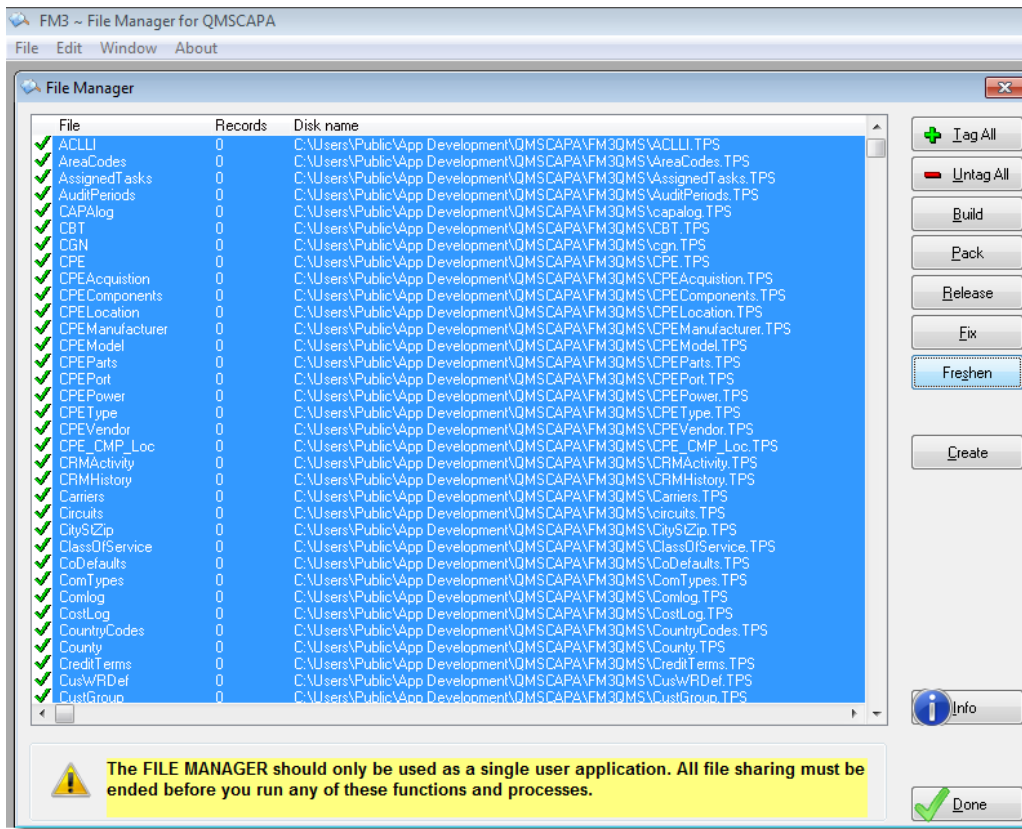

When **FM3QMS.exe** is launched:

1. The select the folder where data files are stored will open.

2. Once the 'Data Path' is selected all databases are scanned for errors and an attempt is made to automatically correct any problems found.

ABC ISO
+1 800 644 2056
abci-consultants.com

Once the scan and repair process has completed the application will pause momentarily allowing the user to manually inspect the files.

If you intend to inspect the files manually then click on the **Use the File Manager** button.

Select the appropriate file with the offending error by using the mouse pointer select or deselect a specific file. Left click on the file name places a check-mark to the left of the file name. First use the Freshen button to correct the file problem. Other options are described below:

- [Tag All] is used to select all files.
- [UnTag All] is used to deselect all files.
- [Build] is used to 'Re-index' the selected file(s).
- [Pack] is used to remove previously 'deleted' records from the selected file(s).
- [Fix] is used to repair the selected file(s). Fix must only be used if the file doesn't come right with Freshen. Don't use Fix on working files, as it can sometimes corrupt them. Fix is your last resort.
- [Freshen] is used to create a new file and copy all the old records out the old file and put them in the new file. Freshen is the best for fixing files, for

getting rid of deleted records, and re-building keys all in one. This effectively removes all duplicate entries (which might be causing the Build to fail) and also can act as an effective fixing of possibly corrupted files.

- [Info] is to look-up the quantity of records in the selected file(s) and show the File Path.
- [Create] is used to create a non-existent file.
- [Done] closes the File Manager.

14.3 Spell Check

F7 = Spell Check

***Spell Check** is available on many of the window forms that contain text fields:

- 1) Click inside the text field and then press the '**F7 key**';
- 2) The 'F7 key' will open the spelling suggestions window with options to Ignore, Change, Add, Ignore All, Change All and/or Cancel. Optionally a word can be typed directly into the [Replace with] field.

***Spell Check** requires Microsoft Office installed on the client computer.

15 Vendor Table

- 1) The General tab shows Vendor name, address and contact information.
- 2) The Quality Management System tab shows ISO certification information.

The screenshot shows a software window titled "Record Will Be Changed (ABCI Consultants)". The window has two tabs: "1) General" and "2) Quality Management System". The "General" tab is active, displaying the following fields:

- ISO Certification: ISO 9001:2008
- ISO Certification No: 8006442056
- ISO Certification Expiry: 12/31/2015
- Comments Notes: A large text area containing the text: "The is the comment/notes field in the Vendor record. A Corrective & Preventative Action tracking software system is essential for any quality system. It is a regulatory requirement that FDA / global regulatory inspectors and ISO auditors consider mission critical. When implemented properly, a Corrective Action (CAPA) software system improves product quality and safety, increases customer satisfaction, and more importantly, ensures FDA and ISO compliance."

At the bottom of the window, there are two buttons: "Save +Close" (with a green checkmark icon) and "Cancel" (with a red X icon).

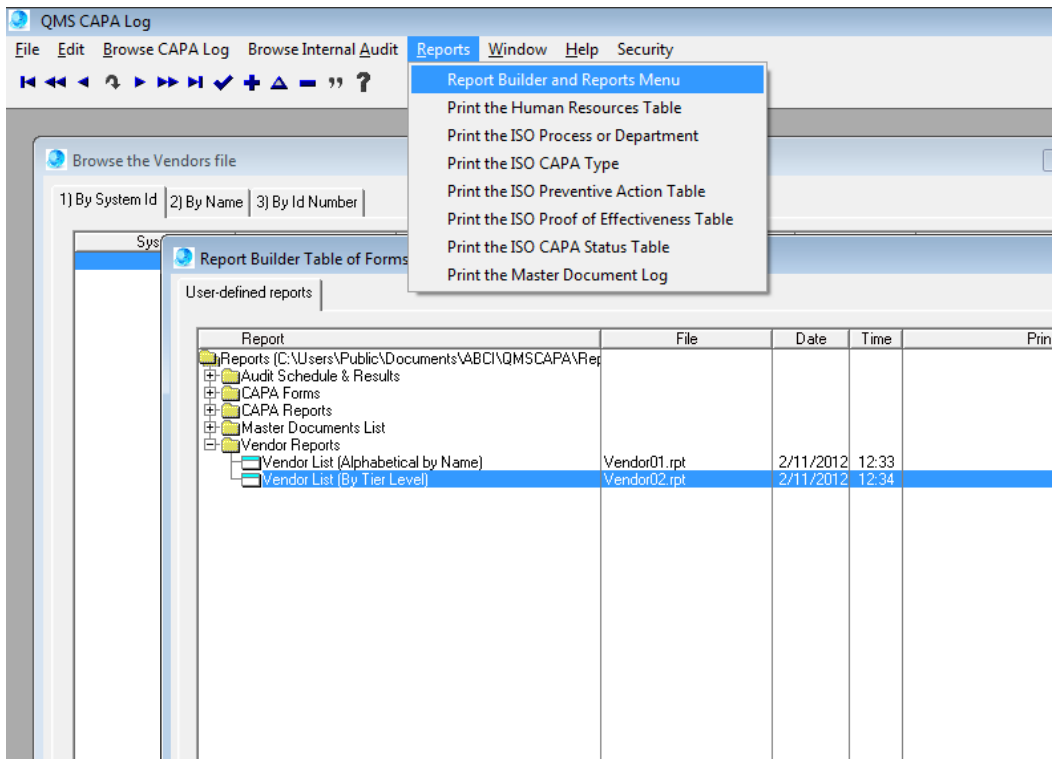

15.2 Vendor Reports

The default Vendor List may be printed from the Vendor Table window.

The screenshot shows a software window with a table of vendor information. A callout box points to the table with the text: "The default vendor report prints in Vendor Name order." Below the table, there are three buttons: "Add" (with a green plus icon), "Edit" (with a blue triangle icon), and "Delete" (with a red minus icon). At the bottom of the window, there are two buttons: "Vendor List" (with a printer icon) and "Close" (with a red power icon).
